SECTION 2 - CALCULATIONS

- A. Present and Developed Drainage Analysis (2, 10, 25, and 100-Year Storms)
- B. Water Quality Calculations
- C. Non-Structural Strategies Point System (NSPS)
- D. Low Impact Development Strategies
- E. Storm Sewer Calculations
- F. Conduit Outlet Protection Calculations
- G. Groundwater Recharge Calculations

SECTION 3 – MAPS

- A. USGS Map
- B. Soil Map
- C. Existing Drainage Area Map
- D. Proposed Drainage Area Map
- E. Inlet Drainage Area Map

A. Introduction

1. Purpose of Report

The purpose of this report is to present the hydrologic criteria and methods used for the stormwater management design for this project. The criteria and methods used in this report are in accordance with the most current Township of Franklin ordinance, New Jersey Department of Environmental Protection (NJDEP) Rules and Regulations, Delaware and Raritan Canal Commission (DRCC) Rules and Regulations, and Standards for Soil Erosion and Sediment Control (SESC) in New Jersey.

2. Project Location

The subject property is approximately 5.50 acres and is known as Block 514, Lot 34 as shown on the tax maps of the Township of Franklin. This project site is bounded by Elizabeth Avenue to the east, Franklin High School property to the south, a residential property to the north and vacant wooded property to the east. A tributary to the Raritan River is located at the northwesterly corner of the site. A USGS map delineating the site location can be found in section 3 of this report.

3. Hydrologic Methodologies

Technical Release No. 55 (TR55) was used to calculate the present and developed runoff from the project site. Hydrographs have been generated for the 2-, 10-, and 100-year storm events. The hydrographs were developed using the New Jersey Region C rainfall distribution and regional rainfall data for Somerset County.

The following parameters were utilized for stormwater management:

1. Reduce the developed peak rate of runoff to 50% of the present peak rate of runoff for the 2-year storm for the area of disturbance
2. Reduce the developed peak rate of runoff to 75% of the present peak rate of runoff for the 10-year storm for the area of disturbance
3. Reduce the developed peak rate of runoff to 80% of the present peak rate of runoff for the 100-year storm for the area of disturbance
4. Provide 80% TSS removal for the proposed development per the BMP Manual

B. Present Land Use and Drainage Patterns

1. Land Use

Presently, the site contains a residential house with an associated parking area near Elizabeth Avenue but is mostly wooded and undeveloped on the remainder of the property

2. Drainage Patterns / Topography and Soils

The site generally drains from south to north contributing runoff toward the tributary to the Raritan River. Portions of the off-site properties located to the south of the site also contribute runoff to this tributary. Additionally, existing inlets along the property frontage (along Elizabeth Avenue) collect runoff from a portion of the site contributing to same tributary to the north. The Soil Survey report, which is found in Section 3 of this report, shows that the existing soils are of hydrologic soil group C on the entire site and contributing off-site drainage area.

A subsurface investigation was performed by Whitestone Associates, Inc. (Whitestone) to evaluate the Seasonal High Groundwater levels and infiltration rates of the site soils. Please refer to the report entitled "Limited Geotechnical Investigation & Stormwater Management Area Evaluation" prepared by Whitestone Associates, Inc. dated March 16, 2020. This report concludes that from test pit data performed within the proposed detention basin area, the elevation of the seasonal high water table ranges between elevations 70.5 and 71.0. Additionally, the infiltration rates were determined to be less than 0.2 inches per hour. This information has been prepared in accordance with Appendix "E" of the NJ BMP Manual.

3. Present Drainage Areas

The present drainage areas are shown on a map entitled "Present Drainage Area Map" found in Section 3 of this report. The contributing drainage area to the tributary (Analysis Point) consists of both on-site and off-site mostly wooded land. These drainage areas are limited to the area of proposed disturbance on-site and all contributing off-site drainage to this area. Hydrographs have been calculated for these areas. Please see the calculations found in Section 2A of this report.

The contributing off-site drainage area was delineated using both field observations and available online topography (Pictometry) which can be found in Section 3 of this report.

Using the data generated by the hydrologic calculations and applying the runoff reductions mentioned above, the following table has been prepared to summarize the Target Peak Flow for the proposed stormwater management design. The following table reduces the peak runoff from the on-site contributing drainage area and adds the contributing off-site peak flow rate to obtain the Target Peak Flow.

TABLE 1. TARGET FLOW CALCULATION					
STORM	EX. PEAK FLOW FROM ON-SITE AREA (CFS)	REDUCTION	REDUCED EX. PEAK FLOW FROM ON-SITE AREA (CFS)	EX PEAK FLOW FROM OFF-SITE AREA (CFS)	AP#1 TARGET PEAK FLOW (CFS)
	A	B	C=A*B	D	E=C+D
2-YR	2.05	50%	1.03	2.22	3.25
10-YR	4.88	75%	3.66	5.03	8.69
100-YR	11.25	80%	9.00	11.19	20.19

Please see Section 2A of this report for the Present Runoff calculations used in the Table above

C. Developed Land Use and Drainage Patterns

1. Land Use

The project proposes to construct a warehouse facility with associated loading docks, car parking, driveways, stormwater management facilities, utilities, landscaping and lighting.

2. Developed Drainage Areas

Once developed, the project will convey the runoff to a combination underground and above-ground detention basin with a single outfall which discharges directly to the tributary. The proposed detention system has been designed to attenuate the required peak flows from the 2-, 10-, and 100-year storm events. The hydrologic calculations can be found in Section 2A of this report.

The following table summarizes the calculations for the developed peak runoff flow rates and compares them to the target peak flow rates from Table 1 above:

Summary of Calculations for Present Runoff and Developed Runoff at the Analysis Point

TABLE 2. TARGET FLOW VS. DEVELOPED FLOW RATES		
STORM	TARGET FLOW (CFS) FROM TABLE 1	DEVELOPED FLOW (CFS)
2-YR	3.25	3.25
10-YR	8.69	5.21
100-YR	20.19	16.85

3. Water Quality

For the proposed development, the Water Quality requirement (minimum runoff treatment to 80% TSS removal from a storm consisting of 1.25-in. of rainfall over 2 hours, or WQ storm event). This requirement is satisfied through the combination of a manufactured treatment devices (ADS BaySaver Barracuda providing 50% TSS Removal), extended detention basins (providing 60% TSS Removal) and vegetative filter strips consisting of existing woodlands (providing 80% TSS Removal).

The runoff from the WQ storm event from a majority of the project will be conveyed through the extended detention basin (24 hours extended detention for 60% TSS removal) and then to the manufactured treatment device (50% TSS removal) at each detention basin. For water quality calculations (including routing of the water quality storm through the extended detention basin) please see Section 2B of this report.

Additionally, stormwater runoff from a portion of the proposed pavement area along the north side of the building will be discharge uncontrolled and overland via curb cuts to vegetative filter strips consisting of existing woodlands. Per the BMP Manual, this would achieve 80% TSS removal. Calculations on the flow rates at each curb cut have been provided in Section 2F of this report.

4. Storm Sewer

The storm system was designed to accept the 25-year peak runoff. Runoff coefficients of 0.51 for hydrologic soil group 'C' open space and 0.99 for impervious areas were used in the Rational Method calculations. A minimum time of concentration of 10 minutes was used. Local rainfall data provided by the National Oceanic and Atmospheric Administration (NOAA) was utilized to determine the average rainfall intensity. A Manning's "n" value of 0.013 was used for reinforced concrete pipe (RCP) and 0.012 was used for HDPE pipe.

Stormwater pipe conveyance calculations have been provided in Section 2 of this report.

5. Groundwater Recharge

The proposed underground recharge basin will provide adequate groundwater recharge for this project. One hundred percent (100%) of the site's average annual pre-developed groundwater recharge volume will be maintained after development. The following table summarizes the results of the calculations:

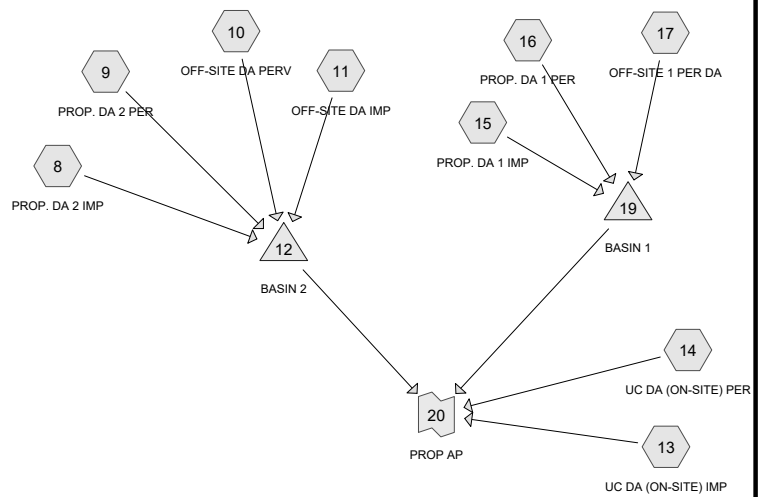

Table No. 5 Summary of Groundwater Recharge	
Groundwater Recharge Deficit	114,000 cubic feet
Groundwater Recharge via Underground Recharge Basin	116,570 cubic feet

Calculations were performed using the New Jersey Groundwater Recharge Spreadsheet (NJGRS) and can be found in Section 2 of this report.

D. Conclusion

The stormwater management design provided will adhere to the most current Township of Franklin development standards, NJDEP Best Management Practices, Delaware and Raritan Canal Commission (DRCC) Rules and Regulations, and the Standards for Soil Erosion and Sediment Control (SESC) in New Jersey. The proposed stormwater management system will provide adequate water quality treatment and runoff flow attenuation. The proposed stormwater management facilities will safely convey all developed runoff from the site and will not have an adverse impact on downstream areas.

SECTION 2B

Proposed TSS Removal Rate

Design Criteria:

Treat all proposed pavement to 80% TSS removal (roof runoff is mixed with runoff from pavement and will need to be treated as well).

Proposed BMPs:

Proposed runoff from the site including proposed pavement will contribute to the extended detention basin which provides 24-hours extended detention and provides 60% TSS Removal per the BMP Manual. The BaySaver Barracuda manufactured treatment device will be located downstream of the extended detention basin and will treat the basin discharge rates to 50% TSS Removal.

Proposed Weighted TSS Removal Rate

$$R = A + B - [(A \times B) / 100] \text{ (Equation 4-1)}$$

Where: R = Total TSS Removal Rate ; A = TSS Removal Rate of the First or Upstream BMP; B = TSS Removal Rate of the Second or Downstream BMP

$$\text{TSS Removal Rate} = 60\% + 50\% - [(60\% \times 50\%) / 100]$$

TSS Removal Rate = 80%

Re: MTD Lab Certification
BaySaver Barracuda™ Hydrodynamic Separator by BaySaver Technologies, LLC
Online Installation

TSS Removal Rate 50%

Dear Mr. Figola:

The Stormwater Management rules under N.J.A.C. 7:8-5.5(b) and 5.7 (c) allow the use of manufactured treatment devices (MTDs) for compliance with the design and performance standards at N.J.A.C. 7:8-5 if the pollutant removal rates have been verified by the New Jersey Corporation for Advanced Technology (NJCAT) and have been certified by the New Jersey Department of Environmental Protection (NJDEP). BaySaver Technologies, LLC has requested an MTD Laboratory Certification for the BaySaver Barracuda™ Hydrodynamic Separator (BaySaver Barracuda).

The project falls under the "Procedure for Obtaining Verification of a Stormwater Manufactured Treatment Device from New Jersey Corporation for Advance Technology" dated January 25, 2013. The applicable protocol is the "New Jersey Laboratory Testing Protocol to Assess Total Suspended Solids Removal by a Hydrodynamic Sedimentation Manufactured Treatment Device" dated January 25, 2013.

NJCAT verification documents submitted to the NJDEP indicate that the requirements of the aforementioned protocol have been met or exceeded. The NJCAT letter also included a recommended certification TSS removal rate and the required maintenance plan. The NJCAT Verification Report with the Verification Appendix (dated September 2017) for this device is published online at <http://www.njcat.org/verification-process/technology-verification-database.html>.

The NJDEP certifies the use of the BaySaver Barracuda by BaySaver Technologies, LLC at a TSS removal rate of 50% when designed, operated, and maintained in accordance with the information provided in the Verification Appendix and the following conditions:

1. The maximum treatment flow rate (MTFR) for the manufactured treatment device (MTD) is calculated using the New Jersey Water Quality Design Storm (1.25 inches in 2 hrs) in N.J.A.C. 7:8-5.5.
2. The BaySaver Barracuda shall be installed using the same configuration reviewed by NJCAT and shall be sized in accordance with the criteria specified in item 6 below.
3. This BaySaver Barracuda cannot be used in series with another MTD or a media filter (such as a sand filter) to achieve an enhanced removal rate for total suspended solids (TSS) removal under N.J.A.C. 7:8-5.5.
4. Additional design criteria for MTDs can be found in Chapter 9.6 of the New Jersey Stormwater Best Management Practices (NJ Stormwater BMP) Manual, which can be found online at www.njstormwater.org.
5. The maintenance plan for a site using this device shall incorporate, at a minimum, the maintenance requirements for the BaySaver Barracuda. A copy of the maintenance plan is attached to this certification. However, it is recommended to review the maintenance website at http://www.ads-pipe.com/pdf/en/Barracuda_Maintenance_07_17.pdf for any changes to the maintenance requirements.
6. Sizing Requirement:

The example below demonstrates the sizing procedure for the BaySaver Barracuda:

Example: A 0.25-acre impervious site is to be treated to 50% TSS removal using a BaySaver Barracuda. The impervious site runoff (Q) based on the New Jersey Water Quality Design Storm was determined to be 0.79 cfs.

Maximum Treatment Flow Rate (MTFR) Evaluation:

The site runoff (Q) was based on the following:

time of concentration = 10 minutes

$i = 3.2$ in/hr (page 5-8, Fig. 5-3 of the NJ Stormwater BMP Manual)

$c = 0.99$ (curve number for impervious)

$Q = ciA = 0.99 \times 3.2 \times 0.25 = 0.79$ cfs

Given the site runoff is 0.79 cfs and based on Table 1 below, the Barracuda Model S4 with a MTFR of 1.25 cfs could be used for this site to remove 50% of the TSS from the impervious area without exceeding the MTFR.

The sizing table corresponding to the available system models is noted below. Additional specifications regarding each model can be found in the Verification Appendix under Table A-1.

Table 1 BaySaver Barracuda Sizing Information

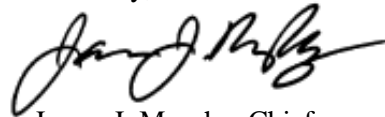

Barracuda Model	NJDEP 50% TSS Maximum Treatment Flow Rate (cfs)	Treatment Area (ft²)	Hydraulic Loading Rate (gpm/ft²)	50% Maximum Sediment Storage (ft³)
S3	0.70	7.07	44.6	5.89
S4	1.25	12.57	44.6	10.47
S5	1.95	19.63	44.6	16.36
S6	2.80	28.27	44.6	23.56
S8	5.00	50.27	44.6	41.89
S10	7.80	78.54	44.6	65.45

A detailed maintenance plan is mandatory for any project with a Stormwater BMP subject to the Stormwater Management Rules, N.J.A.C. 7:8. The plan must include all of the items identified in the Stormwater Management Rules, N.J.A.C. 7:8-5.8. Such items include, but are not limited to, the list of inspection and maintenance equipment and tools, specific corrective and preventative maintenance tasks, indication of problems in the system, and training of maintenance personnel. Additional information can be found in Chapter 8: Maintenance and Retrofit of Stormwater Management Measures.

If you have any questions regarding the above information, please contact Mr. Shashi Nayak of my office at (609) 633-7021.

**DETENTION BASIN WQ FLOW IS
0.08 CFS FOR BASIN #1
0.11 CFS FOR BASIN #2
S3 MODEL REQUIRED FOR 50% TSS REMOVAL**

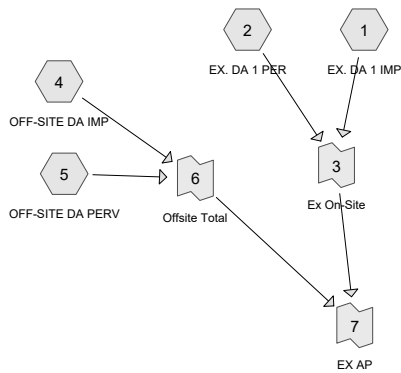

Sincerely,

James J. Murphy, Chief
Bureau of Nonpoint Pollution Control

NJDEP Nonstructural Strategies Points System (NSPS)

Version: January 31, 2006

Note: Input Values in Yellow Cells Only

Project: 490 Elizabeth Ave

Date: December 23, 2020

User: Hammer Land Engineering

Notes:

Step 1 - Provide Basic Major Development Site Information

A. Specify Total Area in Acres of Development Site Described in Steps 2 and 3 = 5.5 **Acres**

B. Specify by Percent the Various Planning Areas Located within the Development Site:

State Plan Planning Area:	PA-1	PA-2	PA-3	PA-4	PA-4B	PA-5	Total % Area
Percent of Each Planning Area within Site:		61.0%			39.0%		100.0%

Note: See User's Guide for Equivalent Zones within Designated Centers and the NJ Meadowlands, Pinelands, and Highlands Districts

Step 2 - Describe Existing or Pre-Developed Site Conditions

A. Specify Existing Land Use/Land Cover Descriptions and Areas:

Site Segment	Land Use/Land Cover Description	Specify Land Use/Land Cover in Acres for Each HSG				Use/Cover Subtotals	Points
		HSG A	HSG B	HSG C	HSG D		
1	Wetlands and Undisturbed Stream Buffers			1.8		1.8	132
2	Lawn and Open Space					0.0	0
3	Brush and Shrub					0.0	0
4	Meadow, Pasture, Grassland, or Range					0.0	0
5	Row Crop					0.0	0
6	Small Grain and Legumes					0.0	0
7	Woods - Indigenous					0.0	0
8	Woods - Planted					0.0	0
9	Woods and Grass Combination			3.6		3.6	182
10	Ponds, Lakes, and Other Open Water					0.0	0
11	Gravel and Dirt					0.0	0
12	Porous and Permeable Paving					0.0	0
13	Directly Connected Impervious			0.1		0.1	0
14	Unconnected Impervious with Small D/S Pervious					0.0	0
15	Unconnected Impervious with Large D/S Pervious					0.0	0
HSG Subtotals (Acres):		0.0	0.0	5.5	0.0		Total Area: 5.5
HSG Subtotals (%):		0.0%	0.0%	100.0%	0.0%		Total % Area: 100.0%

Points Subtotal: **313**

Total Existing Site Points: 313

Step 3 - Describe Proposed or Post-Developed Site Conditions

A. Specify Proposed Land Use/Land Cover Descriptions and Areas:

Site Segment	Land Use/Land Cover Description	Specify Land Use/Land Cover in Acres for Each HSG				Use/Cover Subtotals	Points
		HSG A	HSG B	HSG C	HSG D		
1	Wetlands and Undisturbed Stream Buffers			1.8		1.8	132
2	Lawn and Open Space			1.2		1.2	51
3	Brush and Shrub					0.0	0
4	Meadow, Pasture, Grassland, or Range					0.0	0
5	Row Crop					0.0	0
6	Small Grain and Legumes					0.0	0
7	Woods - Indigenous					0.0	0
8	Woods - Planted					0.0	0
9	Woods and Grass Combination					0.0	0
10	Ponds, Lakes, and Other Open Water					0.0	0
11	Gravel and Dirt					0.0	0
12	Porous and Permeable Paving					0.0	0
13	Directly Connected Impervious			0.8		0.8	0
14	Unconnected Impervious with Small D/S Pervious			0.9		0.9	11
15	Unconnected Impervious with Large D/S Pervious			0.8		0.8	28
HSG Subtotals (Acres):		0.0	0.0	5.5	0.0		Total Area: 5.5
HSG Subtotals (%):		0.0%	0.0%	100.0%	0.0%		Total % Area: 100.0%

Points Subtotal: 222

B. Compare Proposed Impervious Coverage with Maximum Allowable Impervious Coverage:

Total Directly Connected Impervious Coverage =
 Total Unconnected Impervious Coverage with Small D/S Pervious =
 Total Unconnected Impervious Coverage with Large D/S Pervious =
 Total Site Impervious Coverage =
 Effective Site Impervious Coverage =

15%	% of Site
16%	% of Site
15%	% of Site
46%	% of Site
36%	% of Site

Specify Source of Maximum Allowable Impervious Coverage:

Table	(None or Table)
-------	-----------------

Allowable Site Impervious Cover from Maximum Impervious Cover Table:
 Note: See Maximum Impervious Cover Table Worksheet for Details

49%

Points Subtotal: 12

C. Compare Proposed Site Disturbance with Maximum Allowable Site Disturbance:

Total Proposed Site Disturbance =
 Maximum Allowable Site Disturbance by Municipal Ordinance =

68%	% of Site
100%	% of Site

Points Subtotal: 15

D. Describe Proposed Runoff Conveyance System:

Total Length of Runoff Conveyance System =
 Length of Vegetated Runoff Conveyance System =
 % of Total Runoff Conveyance System That is Vegetated =

1377	Feet
888	Feet
64%	

Points Subtotal: 59

E. Residential Lot Clustering:

Percent of Total Site Area that will be Clustered =
 Minimum Standard Lot Size as Per Zoning (Note: 1/2 Acre or Greater) =
 Maximum Proposed Cluster Lot Size (Note: 1/4 Acre or Less) =
 Percent of Clustered Portion of Site to be Preserved as Vegetated Open Space =

	% of Site
	Acres
	Acres
	% of Clustered Site Portion

Points Subtotal: 0

F. Will the Following be Utilized to Minimize Soil Compaction?

Proposed Lawn Areas will be Graded with Lightweight Construction Equipment:
Percent of Proposed Lawn Areas to be Graded with Such Equipment:

Yes
100%

(Yes or No)
% of Lawn Areas

Points Subtotal: **23**

G. Are Any of the Following Stormwater Management Standards Met Using Only Nonstructural Strategies and Measures?

Groundwater Recharge Standards (NJAC 7:8-5.4-a-2):
Stormwater Runoff Quality Standards (NJAC 7:8-5.5):
Stormwater Runoff Quantity Standards (NJAC 7:8-5.4-a-3):

No
No
No

(Yes or No)
(Yes or No)
(Yes or No)

Points Subtotal: **0**

Note: If the Answers to All Three Questions at G Above are "Yes", Adequate Nonstructural Measures have been Utilized.

Total Proposed Site Points: 332

Ratio of Proposed to Existing Site Points: 106%

Required Site Points Ratio: 91%

Nonstructural Point System Results:

Proposed Nonstructural Measures are Adequate

New Jersey Stormwater Best Management Practices Manual

February 2004

A P P E N D I X A

Low Impact Development Checklist

A checklist for identifying nonstructural stormwater management strategies incorporated into proposed land development

According to the NJDEP Stormwater Management Rules at N.J.A.C. 7:8, the groundwater recharge, stormwater quality, and stormwater quantity standards established by the Rules for major land development projects must be met by incorporating nine specific nonstructural stormwater management strategies into the project's design to the maximum extent practicable.

To accomplish this, the Rules require an applicant seeking land development approval from a regulatory board or agency to identify those nonstructural strategies that have been incorporated into the project's design. In addition, if an applicant contends that it is not feasible to incorporate any of the specific strategies into the project's design, particularly for engineering, environmental, or safety reasons, the Rules further require that the applicant provide a basis for that contention.

This checklist has been prepared to assist applicants, site designers, and regulatory boards and agencies in ensuring that the nonstructural stormwater management requirements of the Rules are met. It provides an applicant with a means to identify both the nonstructural strategies incorporated into the development's design and the specific low impact development BMPs (LID-BMPs) that have been used to do so. It can also help an applicant explain the engineering, environmental, and/or safety reasons that a specific nonstructural strategy could not be incorporated into the development's design.

The checklist can also assist municipalities and other land development review agencies in the development of specific requirements for both nonstructural strategies and LID-BMPs in zoning and/or land use ordinances and regulations. As such, where requirements consistent with the Rules have been adopted, they may supersede this checklist.

Finally, the checklist can be used during a pre-design meeting between an applicant and pertinent review personnel to discuss local nonstructural strategies and LID-BMPs requirements in order to optimize the development's nonstructural stormwater management design.

Since this checklist is intended to promote the use of nonstructural stormwater management strategies and provide guidance in their incorporation in land development projects, municipalities are permitted to revise it as necessary to meet the goals and objectives of their specific stormwater management program and plan within the limits of N.J.A.C. 7:8.

Low Impact Development Checklist

A checklist for identifying nonstructural stormwater management strategies incorporated into proposed land development

Municipality: Township of Franklin

County: Somerset Date: 12/22/20

Review board or agency: Township of Franklin/DRCC

Proposed land development name: 490 Elizabeth Ave

Lot(s): 34 Block(s): 514

Project or application number: _____

Applicant's name: ALPHA Finance Corp.

Applicant's address: 53 Knightsbridge Rd, Suite 200

Piscataway, NJ 08854

Telephone: (908) 429-4334 Fax: N/A

Email address: patelh@hotmail.com

Designer's name: Michael A. Rodrigues, Hammer Land Engineering

Designer's address: 663 Raritan Rd, Suite E

Cranford, NJ 07016

Telephone: 732-899-0898 Fax: 888-712-4519

Email address: mike@hammerengineering.com

Part 1: Description of Nonstructural Approach to Site Design

In narrative form, provide an overall description of the nonstructural stormwater management approach and strategies incorporated into the proposed site's design. Attach additional pages as necessary. Details of each nonstructural strategy are provided in Part 3 below.

The existing land cover for the site within the limit of disturbance is predominantly woods and open space. A geotechnical investigation was performed and it was determined that the existing soils have an infiltration rate less than 0.2 inches per hour, therefore the development does not provide any groundwater recharge. The site will utilize an aboveground stormwater basin in conjunction with a below ground detention basin to provide storage of the 2, 10, and 100-year storm events. Stormwater conveyance is provided mostly through curb cuts and vegetated swales on all sides of the property where practicable. The site has been designed to limit the increase in impervious coverage (approximately 46%) and land disturbance (approximately 68%). Wooded areas and areas with native vegetation will be preserved to the furthest extents possible. Regular inspection and maintenance of the proposed stormwater system will be required as indicated in the Operations and Maintenance Manual. Fertilizers if required, will be applied in accordance with the Standards of the Soil Erosion and Sediment Control Act.

Part 2: Review of Local Stormwater Management Regulations

Title and date of stormwater management regulations used in development design:

2004 BMP Manual, revised through 2020

Do regulations include nonstructural requirements? Yes: No:

If yes, briefly describe: Local ordinance references NJAC 7:8.

List LID-BMPs prohibited by local regulations: N/A

Pre-design meeting held? Yes: Date: No:

Meeting held with:

Pre-design site walk held? Yes: Date: No:

Site walk held with:

Other agencies with stormwater review jurisdiction:

Name: Township of Franklin

Required approval: Site Plan Approval

Name: Somerset-Union County Soil Conservation District

Required approval: Soil Erosion and Sediment Contraol Plan Certification

Name: Somerset County Planning Board

Required approval: Site Plan Approval

Part 3: Nonstructural Strategies and LID-BMPs in Design

3.1 Vegetation and Landscaping

Effective management of both existing and proposed site vegetation can reduce a development's adverse impacts on groundwater recharges and runoff quality and quantity. This section of the checklist helps identify the vegetation and landscaping strategies and nonstructural LID-BMPs that have been incorporated into the proposed development's design to help maintain existing recharge rates and/or minimize or prevent increases in runoff quantity and pollutant loading.

A. Has an inventory of existing site vegetation been performed? Yes: No:

If yes, was this inventory a factor in the site's layout and design? Yes: No:

B. Does the site design utilize any of the following nonstructural LID-BMPs?

Preservation of natural areas? Yes: No: If yes, specify % of site: 32%

Native ground cover? Yes: No: If yes, specify % of site: 32%

Vegetated buffers? Yes: No: If yes, specify % of site: 15%

C. Do the land development regulations require these nonstructural LID-BMPs?

Preservation of natural areas? Yes: No: If yes, specify % of site:

Native ground cover? Yes: No: If yes, specify % of site:

Vegetated buffers? Yes: No: If yes, specify % of site:

D. If vegetated filter strips or buffers are utilized, specify their functions:

Reduce runoff volume increases through lower runoff coefficient: Yes: No:

Reduce runoff pollutant loads through runoff treatment: Yes: No:

Maintain groundwater recharge by preserving natural areas: Yes: No:

3.2 Minimize Land Disturbance

Minimizing land disturbance is a nonstructural LID-BMP that can be applied during both the development's construction and post-construction phases. This section of the checklist helps identify those land disturbance strategies and nonstructural LID-BMPs that have been incorporated into the proposed development's design to minimize land disturbance and the resultant change in the site's hydrologic character.

A. Have inventories of existing site soils and slopes been performed? Yes: X No: _____

If yes, were these inventories factors in the site's layout and design? Yes: X No: _____

B. Does the development's design utilize any of the following nonstructural LID-BMPs?

Restrict permanent site disturbance by land owners? Yes: X No: _____

If yes, how: Township of Franklin requires a conservation easement

Restrict temporary site disturbance during construction? Yes: X No: _____

If yes, how: Tree protection, silt fencing and limiting land disturbance around perimeter of site.

Consider soils and slopes in selecting disturbance limits? Yes: _____ No: X

If yes, how: _____

C. Specify percentage of site to be cleared: 68% Regraded: 68%

D. Specify percentage of cleared areas done so for buildings: 20%

For driveways and parking: 41% For roadways: N/A

E. What design criteria and/or site changes would be required to reduce the percentages in C and D above?

F. Specify site's hydrologic soil group (HSG) percentages:

HSG A: 0% HSG B: 0% HSG C: 100% HSG D: 0%

G. Specify percentage of each HSG that will be permanently disturbed:

HSG A: N/A HSG B: N/A HSG C: 68% HSG D: N/A

H. Locating site disturbance within areas with less permeable soils (HSG C and D) and minimizing disturbance within areas with greater permeable soils (HSG A and B) can help maintain groundwater recharge rates and reduce runoff volume increases. In light of the HSG percentages in F and G above, what other practical measures if any can be taken to achieve this?

All of site is located within HSG 'C' soil types.

I. Does the site include Karst topography? Yes: _____ No: X

If yes, discuss measures taken to limit Karst impacts:

3.3 Impervious Area Management

New impervious surfaces at a development site can have the greatest adverse effect on groundwater recharge and stormwater quality and quantity. This section of the checklist helps identify those nonstructural strategies and LID-BMPs that have been incorporated into a proposed development's design to comprehensively manage the extent and impacts of new impervious surfaces.

A. Specify impervious cover at site: Existing: 0.12 Ac. Proposed: 2.52 Ac.

B. Specify maximum site impervious coverage allowed by regulations: 60%

C. Compare proposed street cartway widths with those required by regulations:

Type of Street	Proposed Cartway Width (feet)	Required Cartway Width (feet)
Residential access – low intensity	N/A	N/A
Residential access – medium intensity	N/A	N/A
Residential access – high intensity with parking	N/A	N/A
Residential access – high intensity without parking	N/A	N/A
Neighborhood	N/A	N/A
Minor collector – low intensity without parking	N/A	N/A
Minor collector – with one parking lane	N/A	N/A
Minor collector – with two parking lanes	N/A	N/A
Minor collector – without parking	N/A	N/A
Major collector	N/A	N/A

D. Compare proposed parking space dimensions with those required by regulations:

Proposed: 9' X 18' Regulations: 9' X 18'

E. Compare proposed number of parking spaces with those required by regulations:

Proposed: 30 Regulations: 36

F. Specify percentage of total site impervious cover created by buildings: 20%

By driveways and parking: 41% By roadways: N/A

G. What design criteria and/or site changes would be required to reduce the percentages in F above?

Reducing the number of parking spaces however note that parking provided meets what is required by the ordinance.

H. Specify percentage of total impervious area that will be unconnected:

Total site: 68% Buildings: 18% Driveways and parking: 50% Roads: N/A

I. Specify percentage of total impervious area that will be porous:

Total site: 0% Buildings: 0% Driveways and parking: 0% Roads: N/A

J. Specify percentage of total building roof area that will be vegetated: 0%

K. Specify percentage of total parking area located beneath buildings: 0%

L. Specify percentage of total parking located within multi-level parking deck: 0%

3.4 Time of Concentration Modifications

Decreasing a site's time of concentration (Tc) can lead directly to increased site runoff rates which, in turn, can create new and/or aggravate existing erosion and flooding problems downstream. This section of the checklist helps identify those nonstructural strategies and LID-BMPs that have been incorporated into the proposed development's design to effectively minimize such Tc decreases.

When reviewing Tc modification strategies, it is important to remember that a drainage area's Tc should reflect the general conditions throughout the area. As a result, Tc modifications must generally be applied throughout a drainage area, not just along a specific Tc route.

A. Specify percentage of site's total stormwater conveyance system length that will be:

Storm sewer: 36% Vegetated swale: 64% Natural channel: 0%

Stormwater management facility: 0% Other: N/A

Note: the total length of the stormwater conveyance system should be measured from the site's downstream property line to the downstream limit of sheet flow at the system's headwaters.

B. What design criteria and/or site changes would be required to reduce the storm sewer percentages and increase the vegetated swale and natural channel percentages in A above?

Additional swales, however due to the narrow nature of the site, it is not possible. Also based on infiltration testing, the site does not have suitable infiltration rates. Water quality will be addressed through the use of manufactured treatment devices and extended detention.

C. In conveyance system subareas that have overland or sheet flow over impervious surfaces or turf grass, what practical and effective site changes can be made to:

Decrease overland flow slope: _____

Increase overland flow roughness: Grass areas are already at a minimum slope.

3.5 Preventative Source Controls

The most effective way to address water quality concerns is by pollution prevention. This section of the checklist helps identify those nonstructural strategies and LID-BMPs that have been incorporated into the proposed development's design to reduce the exposure of pollutants to prevent their release into the stormwater runoff.

A. Trash Receptacles

Specify the number of trash receptacles provided: Trash Enclosure

Specify the spacing between the trash receptacles: N/A

Compare trash receptacles proposed with those required by regulations:

Proposed: N/A Regulations: N/A

B. Pet Waste Stations

Specify the number of pet waste stations provided: 0

Specify the spacing between the pet waste stations: N/A

Compare pet waste stations proposed with those required by regulations:

Proposed: _____ Regulations: N/A

C. Inlets, Trash Racks, and Other Devices that Prevent Discharge of Large Trash and Debris

Specify percentage of total inlets that comply with the NJPDES storm drain inlet criteria: 100%

D. Maintenance

Specify the frequency of the following maintenance activities:

Street sweeping: Proposed: TBD Regulations: N/A

Litter collection: Proposed: TBD Regulations: N/A

Identify other stormwater management measures on the site that prevent discharge of large trash and debris:

Operations and maintenance manual

E. Prevention and Containment of Spills

Identify locations where pollutants are located on the site, and the features that prevent these pollutants from being exposed to stormwater runoff:

Pollutant: N/A Location: N/A

Feature utilized to prevent pollutant exposure, harmful accumulation, or contain spills:

Pollutant: N/A Location: N/A

Feature utilized to prevent pollutant exposure, harmful accumulation, or contain spills:

Pollutant: N/A Location: N/A

Feature utilized to prevent pollutant exposure, harmful accumulation, or contain spills:

Pollutant: N/A Location: N/A

Feature utilized to prevent pollutant exposure, harmful accumulation, or contain spills:

Pollutant: N/A Location: N/A

Part 4: Compliance with Nonstructural Requirements of NJDEP Stormwater Management Rules

1. Based upon the checklist responses above, indicate which nonstructural strategies have been incorporated into the proposed development's design in accordance with N.J.A.C. 7:8-5.3(b):

No.	Nonstructural Strategy	Yes	No
1.	Protect areas that provide water quality benefits or areas particularly susceptible to erosion and sediment loss.	X	
2.	Minimize impervious surfaces and break up or disconnect the flow of runoff over impervious surfaces.	X	
3.	Maximize the protection of natural drainage features and vegetation.	X	
4.	Minimize the decrease in the pre-construction time of concentration.	X	
5.	Minimize land disturbance including clearing and grading.	X	
6.	Minimize soil compaction.	X	
7.	Provide low maintenance landscaping that encourages retention and planting of native vegetation and minimizes the use of lawns, fertilizers, and pesticides.	X	
8.	Provide vegetated open-channel conveyance systems discharge into and through stable vegetated areas.	X	
9.	Provide preventative source controls.	X	

2. For those strategies that have not been incorporated into the proposed development's design, provide engineering, environmental, and/or safety reasons. Attached additional pages as necessary.

The site layout design makes a concerted effort to disconnect runoff from impervious surfaces along with preserving existing natural areas. Stormwater runoff quality and attenuation will be provided. Groundwater recharge is not required since the site soils have an infiltration rate of less than 1 inch per hour.

Procedure to fill the Pre-Development and Post-Development Conditions Tables

For each land segment, first enter the area, then select TR-55 Land Cover, then select Soil. Start from the top of the table and proceed downward. Don't leave blank rows (with A=0) in between your segment entries. Rows with A=0 will not be displayed or used in calculations. For impervious areas outside of standard lots select "Impervious Areas" as the Land Cover. Soil type for impervious areas are only required if an infiltration facility will be built within these areas.

CALCULATION CHECK MESSAGES							
Volume Balance-> Solve Problem to satisfy Annual Recharge							
dBMP Check--> OK							
dEXC Check--> OK							
BMP Location--> OK							
OTHER NOTES							
Pdesign is accurate only after BMP dimensions are updated to make rech volume= deficit volume. The portion of BMP infiltration prior to filling and the area occupied by BMP are ignored in these calculations. Results are sensitive to dBMP, make sure dBMP selected is small enough for BMP to empty in less than 3 days. For land Segment Location of BMP if you select "impervious areas" RWC will be minimal but not zero as determined by the soil type and a shallow root zone for this Land Cover allowing consideration of lateral flow and other losses.							
the soil type and a shallow root zone for this Land Cover allowing consideration of lateral flow and other losses.							
and "Aimp" on this page. This allows solution for a single BMP to handle the entire recharge requirement assuming the runoff from entire impervious area is available to the BMP.							
To solve for a smaller BMP or a LID-IMP to recharge only part of the recharge requirement, set Vdef to your target value and Aimp to impervious area directly connected to your infiltration facility and then solve for ABMP or dBMP. To go back to the default configuration click the "Default Vdef & Aimp" button.

CALCULATION CHECK MESSAGES							
Volume Balance-> Solve Problem to satisfy Annual Recharge							
dBMP Check-> OK							
dEXC Check-> OK							
BMP Location-> OK							
OTHER NOTES							
Pdesign is accurate only after BMP dimensions are updated to make rech volume= deficit volume. The portion of BMP infiltration prior to filling and the area occupied by BMP are ignored in these calculations. Results are sensitive to dBMP, make sure dBMP selected is small enough for BMP to empty in less than 3 days. For land Segment Location of BMP if you select "impervious areas" RWC will be minimal but not zero as determined by the soil type and a shallow root zone for this Land Cover allowing consideration of lateral flow and other losses.

Climatic Factor	C-factor	1.48	no units				
Average Annual P	Pavg	45.7	in				
Recharge Requirement over Imp. Area	dr	12.5	in				
How to solve for different recharge volumes: By default the spreadsheet assigns the values of total deficit recharge volume "Vdef" and "Aimp" on this page. This allows solution for a single BMP to handle the entire recharge requirement assuming the runoff from entire impervious area is available to the BMP. To solve for a smaller BMP or a LID-IMP to recharge only part of the recharge requirement, set Vdef to your target value and Aimp to impervious area directly connected to your infiltration facility and then solve for ABMP or dBMP. To go back to the default configuration click the "Default Vdef & Aimp" button.							

Proposed Recharge Volume Underground Basin 2
Contributing Impervious Drainage Area is 20,909 SF
Available Volume for Recharge is the 9" thick stone base beneath the system invert (7,870 SF system, 40% Void Ratio)

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
 Web Soil Survey URL:
 Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Somerset County, New Jersey
 Survey Area Data: Version 17, Sep 16, 2019

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jun 22, 2019—Jul 13, 2019

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI

RoyB	Royce silt loam, 2 to 6 percent slopes	C	12.1	24.0%
Totals for Area of Interest			50.2	100.0%

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Rating Options

Aggregation Method: Dominant Condition

Component Percent Cutoff: None Specified

¹ Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).
 Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.
 Please refer to NOAA Atlas 14 document for more information.
