RE: Traffic Impact Study & Parking Review
Dada Bhagwan Vignan Institute
SSE 20-02-1680

Sam Schwartz Consulting, LLC (Sam Schwartz) has reviewed the above referenced application. Specifically, Sam Schwartz has reviewed the following materials with a focus on traffic and parking impacts:

- 1. Site plan prepared by The Reynolds Group, Inc. last revised 2/12/21
- 2. Architectural plans by Mistry Design, last revised 9/27/19
- 3. Traffic Impact Study (TIS) by Dolan & Dean dated 11/21/19
- 4. Dada Bhagwan Vignan Institute Schedule and attendee report (as of November 2020)

Based on the review of these materials and attendance at the virtual hearings, Sam Schwartz offers the following traffic, parking, and circulation related comments.

Existing Traffic Conditions - South Middlebush Road (Somerset County 615) is a narrow two-lane roadway providing one travel lane in each direction with no shoulders. The travel lanes are less than 12 feet in width. There are heavy traffic volumes on this roadway as it serves as a regional Urban Minor Arterial. The posted speed limit along South Middlebush Road is 45 miles per hour (mph), however, during field visits vehicles speeds were observed over 45 mph on a regular basis in non-peak hours.

Based on traffic volume data provided in the Dolan & Dean TIS, traffic volumes along South Middlebush Road range during the average weekday from 1,000 vehicles per hour (vph) at 6 am to 1,000 vph at 7 pm with temporal variations during the day. **ATTACHMENT A** depicts the traffic data in graphic form. During the Weekday AM Peak Period (from 7 am to 9 am) traffic is steady at 1,800 vph, indicating the roadway is operating at Analytical Capacity and Peak Hour Spreading (peak traffic volumes spill over or occur longer than just one hour). Similarly, during the Weekday PM Peak Period (from 3 pm to 7 pm) traffic is steady at 1,500 vph – 1,800 vph, indicating the roadway is operating at capacity and Peak Hour Spreading is occurring over a longer period. The Saturday traffic volumes are consistently 1,000 vph from 9 am to 7 pm.

Trip Generation for this proposed site, as reported in the Dolan & Dean report dated 11/21/19, was based on client provided information that 150 to 175 people may visit the site between 6:00pm and 10:00pm after the evening rush hour on Fridays.

Page 2 of 3 June 15, 2021 Letter Report to Martina Baillie, Esq. Sam Schwartz

Re: Traffic Impact Study & Parking Review Dada Bhagwan Vignan Institute

In addition, the report identifies the twice a year on Saturday and Sunday there will be 225 to 250 people visiting the site. The projected number of new vehicles, estimated in the report, is **"50 vehicles could possibly enter the site during one hour or leave in one hour".**

This assumes 3 people per vehicle on average which seems to be a high on-average calculation.

Based on the Institute of Transportation Engineers (ITE) Trip Generation Manual, 12th Edition (21,833 gfa). **ATTACHMENT B** contains detailed ITE Trip Generation calculations.

Land Use 562 Mosque

Friday AM Peak
Friday PM Peak Hour

208 (of the Generator) 3.5x higher
401(of the Generator) 6.5x higher

Land Use 560 Church

Sunday Peak Hour **242** (of the Generator) 4.0x higher

Land Use 561 Synagogue

Sunday Peak Hour 171 (of the Generator) 3.0x higher

Based on ITE, there would be 3 to 6.5 times the estimated new vehicles stated in the traffic report.

The Board could request the applicant prepare revised intersection analyses based on 100 vehicles entering/exiting the site and another using 150 vehicles to fully understand the traffic impacts along South Middlebush Road (SMR).

Access to/from the Site from SMR – Based on applicants TIS, the proposed driveway, specifically the southbound left turn into the site, would operate at an acceptable Level of Service (LOS), however, this does not take into account congestion along SMR, lack of gaps in traffic to complete the left turn, and is based on only 25 vehicles making the left turn. From a qualitative review, if these factors were incorporated into the analysis, along with perhaps 100 vehicles making the left turn into the site, the intersection would have a FAILING LOS (ATTACHMENT C provides detailed HCS analyses).

In similar fashion, vehicles exiting the site would also have a difficult time finding gaps in traffic from the proposed one-lane exit.

The SAI DATTA Traffic Impact Study (also prepared by Dolan & Dean) should have been taken into account for this application since the proposed site is only 1,350 feet (approximately) to the north along SMR. The unsignalized proposed driveway intersection is predicted to operate at Level Of Service E, however, the Traffic Impact Study does not indicate how long the queue of vehicles would be extending into the site. Lighting at the proposed site driveway must also be addressed for safety considerations.

On-Site circulation / **Safety** – could be an issue if many vehicles are exiting the proposed one-lane driveway.

Page 3 of 3 June 15, 2021 Letter Report to Martina Baillie, Esq. Sam Schwartz

Re: Traffic Impact Study & Parking Review Dada Bhagwan Vignan Institute

Potential traffic impacts - should be considered along SMR, including additional traffic congestion along SMR, safety issues at the driveway intersection, southbound left turn into the site causing additional queuing and congestion along SMR, and the potential compounding traffic congestion with other proposed projects along SMR (including the Sai Datta project) and the cumulative traffic conflicts and congestion.

The Board should require input from the County before any approval to better understand if the County will require widening of SMR to provide for an exclusive southbound left turn into the site, if SMR would be widened from this project to the proposed Sai Data project, or if the County WILL NOT permit any widening --- in which case the proposed site driveway could be a traffic and safety issue.

Parking Requirements - for the project should consider a calculation based on the square footage of the worship area which would require 457 parking spaces and only 157 are provided. Based on the *ITE Parking Generation Manual* (5th Edition), the site would require from 363 to 420 parking spaces for a typical Mosque (Land Use Code 562) based on square footage (**ATTACHMENT D** contains detailed calculations). This is more in line with the 457 spaces required by code, and certainly much more than the 157 spaces proposed. This would be a 206 to 300 parking space variance request.

Regards,

Lou Luglio, PE Vice President
