1. Introduction

The subject property is located at 100 Commerce Drive in the Township of Franklin, Somerset County, New Jersey. The property is identified as Block 86.03, Lot 10.32 on the Township of Franklin tax maps and is a total of 29.58 acres in size and will hereafter be referred to as "the site". The site is bordered to the northeast and northwest by residential properties and Amwell Road beyond; to the east by Franklin Sewage Authority and other commercial uses, with Jiffy Road beyond; to the west by Dahmer Road with residential properties beyond; and to the south by Commerce Drive, Nature Flooring Industries and other commercial uses, with residential properties beyond. A tax map, soil map, and USGS map are included at the beginning of Appendix C for reference.

The site is currently occupied with the existing ±305,200 SF L'Oreal USA Franklin building, along with other existing site features which include an extended detention basin and a bioretention basin, associated parking and driveway areas, loading docks, and landscaping. The site is located within the B-1 Zone, where industrial uses are permitted. The proposed improvements include expanding the existing L'Oreal manufacturing building, which will occur in several phases and will ultimately increase the building floor area to a total of approximately 551,790 SF. Other proposed features include, but are not limited to, additional parking stalls, sidewalks, lighting and landscaping, and utility improvements. A proposed stormwater management system will convey the runoff from the proposed development and impervious areas to new small-scale bioretention basins before being discharged off of the site.

This report summarizes the design objectives, methodology, and calculations for the conveyance, detention, treatment and discharge of stormwater runoff leaving the site and is meant to accompany the Site Plan documents prepared by Bohler Engineering. Pre-development and post-development conditions are examined for stormwater quantity analysis, water quality analysis, groundwater recharge, soil erosion and sediment control, and low impact development based on the *NJDEP Stormwater Management Regulations* of March 2021.

2. Pre-Development Site Conditions

The site contains a total area of 29.58 acres, which is also the size of the studied watershed area. The site consists of three unique drainage areas, which drain to three separate points of analysis. These analysis points are identified as Point of Interest #1 (POI #1), Point of Interest #2 (POI #2) and Point of Interest #3 (POI #3). In the pre-development condition, the site is occupied by the existing L'Oreal commercial/industrial facility on the southern portion of the lot, along with its associated parking, driveway, and landscaped areas. The northern area of the site is currently undeveloped and consists primarily of wooded area. Currently, the runoff generated on the developed portion of the site outfalls to a regional stormwater management basin to the southeast of the site after passing through the existing extended detention and bioretention basins. Drainage from the undeveloped wooded area splits between an existing wetland area along the western

property line and the northeast corner of the site. The Existing Drainage Area Map in Appendix C illustrates the limits of each existing drainage area and how they relate to the existing site conditions.

2.1 Point of Interest #1

Point of Interest #1 (POI #1) is located at the southeastern corner of the site within Commerce Drive, and is comprised of several sub-drainage areas as defined in the following sections. POI #1 can be described as the point where all on-site sub-drainage areas ultimately flow to, which in this case is a junction drainage inlet in the street. The Existing Drainage Area Map in Appendix C illustrates the identified point of analysis and how it relates to the existing topography and drainage infrastructure on the site.

2.1.1 Existing Drainage Area #1A (EDA-1A)

EDA-1A contains 17.88 acres of land, of which 10.52 acres are impervious area, which includes the entirety of the roof area from the existing buildings, a majority of the rear driveway and loading dock area, the western and southern parking areas, and a portion of the wooded area to the north which sheet flows into the developed area of the site. The topography of the area slopes generally from north to south from a maximum elevation of approximately 118' to a minimum elevation of approximately 106' with slopes ranging from 1% to 10%. CN values of 98, 74 and 72 were used for impervious, pervious, and wood/grass combination areas, respectively, with a calculated time of concentration of 26.4 minutes. The runoff from EDA-1A sheet flows to a series of surface inlets and drains, and then flows through the existing storm sewer pipes and structures on the site. EDA-1A discharges directly to POI #1.

2.1.2 Existing Drainage Area #1B (EDA-1B)

EDA-1B contains 5.73 acres of land, of which 1.36 acres are impervious pavement surfaces, and includes the on-site area draining to the existing extended detention facility along the eastern side of the property. The topography of the area slopes from north to south from a maximum elevation of approximately 117' to a minimum elevation of approximately 104' at the extended detention basin, with slopes ranging from 0.5% to 10%. CN values of 98, 74 and 70 were used for impervious, pervious, and wooded areas, respectively, with a calculated time of concentration of 15.3 minutes. The runoff from Existing Drainage Area #1B flows from the wooded area on the northeast corner of the site and collects in the pavement area to the east of the primary building, where it is collected by surface inlets and conveyed via storm sewer pipe to the extended detention basin. The runoff is then retained in the extended detention

basin and released at a controlled rate into the adjacent bioretention basin along the eastern property line, which then outfalls to POI #1.

2.1.3 Existing Drainage Area #1C (EDA-1C)

EDA-1C contains 1.15 acres of grass/shrub coverage (CN = 74), which includes the on-site area draining directly to the existing bioretention basin via sheet flow. The bioretention basin was previously designed with an earthen spillway as the primary method of discharge, which is directed out to Commerce Drive and POI #1.

2.2 Point of Interest #2

Point of Interest #2 (POI #2) is located near the northwestern corner of the site along Dahmer Road, which has been identified as a localized depression and wetlands area by NJDEP. The area draining to POI #2 is identified as Existing Drainage Area #2, which is comprised of 3.54 acres of wooded area (CN=70) and 0.06 acres of impervious coverage from the site. The time of concentration for POI #2 was calculated as 19.6 minutes. Runoff within this area drains via sheet flow either directly to the wetlands area, or to existing storm sewer inlets within Dahmer Road, which then discharge to the wetland areas to the west of the site. The Existing Drainage Area Map in Appendix C illustrates the identified point of analysis and how it relates to the existing topography and drainage infrastructure on the site.

2.3 Point of Interest #3

Point of Interest #3 (POI #3) is located at the northeastern corner of the site abutting Block 600, Lot 2.01 and Block 86.03, Lot 1.08. The area draining to POI #3 is identified as Existing Drainage Area #3, which is comprised of 1.23 acres of wooded area (CN=70) and drains via sheet flow to the property boundary and then off of the site. The time of concentration for POI #3 was calculated as 15.2 minutes. The Existing Drainage Area Map in Appendix C illustrates the identified point of analysis and how it relates to the existing topography and drainage infrastructure on the site.

3. Post-Development Site Conditions

The post-development condition for the site includes the construction of a 246,590 SF expansion to the existing building, bringing the total building coverage for the site to be approximately 551,790 SF. The project also proposes to construct additional driveways, loading areas, parking stalls around the perimeter of the site, and landscaping improvements. The proposed site is designed in a manner that generally maintains the existing drainage patterns. The studied watershed area in the post-development condition contains the same 29.58-acre area that was studied in the pre-development condition and consists of several unique drainage areas related

to the three (3) primary points of analysis. The post-development drainage areas and sub-drainage areas are described in more detail in the following sections below.

In addition to the building expansion and associated site improvements, a proposed stormwater conveyance system will collect the runoff from the proposed roofs, pavement and loading areas via inlets, manholes, trench drains and stormwater piping. A portion of the collected runoff will be redirected to the proposed bioretention basins (described further below), and subsequently discharged to the existing extended detention basin, while the remainder of the existing development will drain to Commerce Drive as it does currently. The construction of the proposed improvements will disturb approximately 11 acres of land and will create approximately 7.9 acres of additional impervious coverage (± 2.2 acres of additional motor vehicle surface) on the site in the post-development condition. The Proposed Drainage Area Map in Appendix C illustrates the limits of each proposed drainage area and how they relate to the proposed site conditions

3.1 Point of Interest #1

The sub-drainage areas for POI #1 in the post development condition flow to the same point of analysis identified in the existing condition, located near the southeastern property corner within Commerce Drive. As noted above, the Proposed Drainage Area Map in Appendix C illustrates the identified point of analysis and how it relates to the proposed topography on the site.

3.1.1 Proposed Drainage Area #1A (PDA-1A)

PDA-1A corresponds to EDA-1A in terms of upstream tributary area, where runoff is eventually conveyed through the existing storm sewer system on the southern and western portions of the site and discharged to POI #1 through Commerce Drive.

PDA-1A is further broken down into PDA-1A-a and PDA-1A-b, which are individual areas draining to the proposed porous pavement systems to the west of the proposed building expansion. These areas are comprised of 0.13 acres and 0.39 acres of motor vehicle surface area, respectively. The porous pavement systems provide water quality treatment for runoff, which is then discharged via control orifices downstream to the existing storm sewer network. The porous pavement outflows then join with the remainder of the existing building, parking areas, and open space to the south and west of the site (noted as PDA-1A-c) for conveyance to Commerce Drive and eventually POI #1. PDA-1A-c is comprised of approximately 3.30 acres of open space and 9.51 acres of impervious and roof area.

3.1.2 Proposed Drainage Area #1B (PDA-1B)

PDA-1B also corresponds to EDA-1B in terms of upstream tributary area, where runoff is eventually conveyed to the existing extended detention basin on the eastern side of the site and subsequently discharged to POI #1 via the extended detention basin's outlet control structure and the adjacent bioretention basin.

PDA-1B is further broken down into PDA-1B-a and PDA-1B-b, which are individual areas draining to the proposed bioretention basins near the northeast corner of the building expansion. PDA-1B-a is comprised of 0.53 acres of grass area, 0.27 acres of wooded area, and 0.69 acres of motor vehicle surface, while PDA-1B-b is comprised of 0.15 acres of grass surface and 0.73 acres of motor vehicle surface. The bioretention basins provide water quality treatment for tributary runoff, which is then discharged via control orifices and underdrains downstream to the existing storm sewer network. The basin outflows then join with the remainder of the parking and loading areas to the east of the building, which is noted as PDA-1B-c. A portion of PDA-1B-a also includes a porous asphalt pavement and stone storage area (PDA-1B-d) which will outflow to the bioretention basin in PDA-1B-a. PDA-1B-c is comprised of approximately 2.81 acres of open grass space, and 1.32 acres of impervious motor vehicle surface area (1.18 acres of existing pavement vs. 0.14 acres of increase proposed). Collectively, PDA-1B ultimately drains to the extended detention basin to the east of the loading area via several inlets and headwalls along the curb line. An assumed time of concentration of 10 minutes was utilized for PDA-1A and PDA-1B, as the wooded area to the north of the site is proposed to be removed, which was the primary cause of the higher existing concentration time. The routing of the runoff from these drainage areas is reflected on the Inlet Area Map in Appendix C and is accounted for throughout the other Appendices of this report.

3.1.3 Proposed Drainage Area #2 (PDA-2)

PDA-2 remains mostly unchanged compared to EDA-2, where runoff drains via sheet flow from the northwestern portion of the site to the western property line, and ultimately to the existing isolated wetland area at POI #2. PDA-2 is comprised of 1.77 acres of wooded area, which is reduced from the existing condition and therefore will comply with all NJDEP criteria for off-site runoff volume, peak flow rates, and water quality.

3.1.4 Proposed Drainage Area #3 (PDA-3)

Similar to PDA-2, PDA-3 remains mostly unchanged compared to EDA-3. Runoff will continue to drain from west to east along the northern property line and eventually drain off the site at the northeast corner, where POI #3 is located. PDA-3 is comprised of 0.88 acres of wooded area, which is reduced from the

existing condition and therefore will comply with all NJDEP criteria for off-site runoff volume, peak flow rates, and water quality.

3.2 Proposed Structural Stormwater Management Strategies

Several stormwater management strategies have been utilized for the post-development condition in compliance with the regulations set forth by NJDEP for water quantity, water quality, and groundwater recharge, while also providing several “Green Infrastructure” features. These strategies are described in more detail below.

3.2.1 Bioretention Systems

As part of the stormwater management design of the proposed site, a bioretention system is proposed to capture water from impervious areas. The bioretention system meets the minimum requirements outlined in the *New Jersey Stormwater Best Management Practices Manual* by providing 18 inches of soil bed depth, an underdrain system, containment and treatment of the entire Water Quality Design Storm volume, a storage depth of 12 inches maximum in a flat-bottom system, and 1 foot minimum of separation between the bottom of the bioretention basin and the seasonal high ground water table for underdrain systems. Therefore, the bioretention systems will achieve 80% TSS removal per the table below.

TABLE 3.2.1

DESIGN PARAMETERS		
TSS Removal Rate	Depth of Soil Bed	Vegetation
80%	18 inches	Terrestrial Forested Community
80%	24 inches	Site-Tolerant Grasses
90%	24 inches	Terrestrial Forested Community
Storage Volume	Entire Water Quality Design Storm Volume	
Minimum Density of Vegetation	85%	
Appropriate Species Selection	See Chapter 7 of the <i>NJ Stormwater Best Management Practices Manual</i>	
Maximum Design Storm Drain Time	72 Hours, Using Slowest Design Permeability Rate	
Permeability Rate Factor of Safety	2	
Minimum Subsoil Design Permeability Rate	0.5 inches/hour	

Soil Testing Requirements	Must be consistent with Appendix E of the <i>NJ Stormwater Best Management Practices Manual</i>
----------------------------------	---

3.2.2 Pervious Paving Systems

Pervious paving materials have been proposed as part of the overall site design and stormwater management system to reduce the impermeable impervious surface on site, while also providing 80% TSS removal for pervious paved surfaces and their tributary areas. The pervious pavement also provide additional storage volume for larger storm events to minimize the sizes of downstream conveyance pipes and basin systems. The pervious paving systems have been designed to have a maximum ratio of additional inflow area to the pavement surface area of 3:1 or less, a maximum surface slope of 5%, a storage bed that fully contains the Water Quality Design Storm runoff volume, and to discharge the design storm within 72 hours of a rain event.

Infiltration through the bottom of the pervious paving systems is not available for the site due to the presence of hydrologic soil group D strata and impermeable subsoils, and therefore multiple series of underdrains have been provided for the site to promote drain-down of the stone storage. The underdrain systems are also designed in conjunction with proposed inlets with grates for maintenance access and to provide overflow relief in the event of a surcharged condition.

TABLE 3.2.2

DESIGN PARAMETERS	
Porous Asphalt, Pervious Concrete and Permeable Interlocking Paver Units	6.4 inches/hour Minimum Infiltration Rate

3.2.3 Emergency Overflow

The emergency drainage design associated with the proposed bioretention basins have been incorporated into the proposed outlet structures. The horizontal grates at the top of each structure are set slightly above the 100-year storm elevation, meaning they will only be utilized under emergency conditions to pass a design storm that is equivalent to the 100-year storm plus 50%. Approximately one foot of freeboard is provided above the peak water elevation while the emergency grate overflow is operating.

3.3 Pre- vs. Post-Development Flow Summary

TABLE 3.3
FLOW SUMMARY TABLE

	EDA-1 (POI-1)	PDA-1 (POI-1)	EDA-2 (POI-2)	PDA-2 (POI-2)	EDA-3 (POI-3)	PDA-3 (POI-3)
2 yr. Flow (cfs)	22.86	29.15	1.91	0.91	0.59	0.42
10 yr. Flow (cfs)	38.73	46.70	4.32	2.09	1.34	0.96
100 yr. Flow (cfs)	70.20	15.79	9.60	4.69	3.00	2.15

4. Stormwater Management Design Methodology

In accordance with the NJDEP Stormwater Management Regulations, the proposed development must meet the requirements, if appropriate, for stormwater quantity reductions, water quality, groundwater recharge, soil erosion and sediment control, and low impact development. The following sections describe how each of the above items are addressed on site in the post-development condition.

4.1 Stormwater Quantity Controls

The Assessment of stormwater quantity has been based upon the Soil Conservation Service Method (SCS) Unit Hydrograph as described in Technical Release Number 55 (TR55), "Urban Hydrology for Small Watersheds". Theoretical storms are modeled with the 24-Hour SCS Unit Dimensionless Hydrograph using the NOAA Atlas 14 Type C rainfall distribution and recurrence intervals of 2, 10, and 100 years. Hydrograph creation and routings are accomplished using the *HydroCAD* Version 10.00 program by HydroCAD Software Solutions, LLC. The following techniques from the *NJDEP Stormwater Management Regulations* is being applied to each drainage area as noted in section 3.3:

1. NJAC § 7:8-5.6(b)1 states for stormwater runoff leaving the site, post-development runoff hydrographs for the 2-, 10-, and 100-year storms do not exceed, at any point in time, the pre-development runoff hydrographs for the same storm events. The above section of the NJAC will be applied to drainage areas that, under proposed conditions, will remain unchanged or have a net decrease in impervious coverage and/or a net decrease in total area.
2. NJAC § 7:8-5.6(b)3 states the post-development peak runoff rates for the 2-, 10-, and 100-year storm events are 50, 75, and 80 percent, respectively, of the pre-

- development peak runoff rates. The above section of the NJAC will be applied to drainage areas that are impacted by the proposed development and flow to a detention or retention system.
3. NJAC § 7:8-5.6(b)4 states in tidal flood hazard areas, stormwater runoff quantity analysis in accordance with the above quantity criteria shall only be applied if the increase in volume of stormwater runoff could increase flood damages below the point of discharge.

Quantity control for PDA-2 and PDA-3 is achieved using Method 1 above (NJAC 7:8-5.6(b)1). The stormwater leaving the site in these two areas, post-construction runoff hydrographs for the two-, 10-, and 100-year storm events do not exceed, at any point in time, the pre-construction runoff hydrographs for the same storm events. A comparison of the hydrographs is included in Appendix A.

Quantity control for PDA-1 involves an evaluation of the existing regional stormwater management basin to the south of the site and across Commerce Drive. An evaluation of the regional basin was performed using topographic information available from NOAA (National Oceanic and Atmospheric Administration) in order to determine the drainage area and storage capacity of the existing regional basin. Assuming full build out of the drainage area based on maximum impervious coverage allowances in the zoning district it was determined that the basin volume is sufficient to detain and attenuate the additional impervious surfaces proposed by the development. A HydroCAD model for the regional basin is provided in Appendix A. In addition, the existing on-site detention basin provides attenuation for the design storms therefore lessening the runoff directed to the regional basin. The existing on-site detention basin was designed based on a proposed building expansion in 2013 and subsequently built. However, the proposed addition was not completed to date and therefore is of sufficient capacity to detain a portion of the expansion proposed as part of this application. Our office is in the process of obtaining existing conditions topography for the regional basin to confirm/assess the capacity. Updated analysis will be provided under separate cover when this information is available.

4.1.1 Site Soils

Site soil information has been obtained from the USDA Natural Resources Conservation Service (NRCS) web soil survey database, last revised in 2012. The major soil types present on site include Penn Silt Loam, which is a somewhat poorly drained soil with 2 to 6 percent slopes. Penn soils are classified as Hydrologic Soil Group Type C soils; therefore, values used in the CN and time of concentration calculations are associated with Type C soils. For areas where the calculated time of concentration is less than 10 minutes, a minimum of 10 minutes was used.

4.1.2 Rainfall Data

Rainfall data used in the stormwater calculations of this report are obtained from several different sources based on the latest NJDEP stormwater regulations. The Water Quality storm event is based on the NJDEP BMP Manual Chapter 5 definition of having a total rainfall depth of 1.25 inches and a total duration of two (2) hours. Twenty-four-hour rainfall frequency data in Somerset County for all other storms is obtained from the NOAA Atlas 14, Volume 2, Precipitation-Frequency Atlas of the United States, updated in 2006 and listed in the table below:

TABLE 4.1

Event (year)	2	10	25	100
Rainfall (in)	3.34	5.01	6.15	8.21

4.1.3 Pipe Sizing

Calculations for sizing the stormwater pipe networks associated with the proposed stormwater management conveyance system can be found in Appendix B of this report. The Rational Method has been used to size the storm piping for the 25-year storm event. The calculations are conservatively based on a time of concentration of 10 minutes to any inlet. An Inlet Area Map is included in Appendix C.

4.2 Water Quality Controls

Water quality analysis is based on the requirements of NJAC § 7:8-5.5, which requires 80% TSS removal of post-development runoff from new motor vehicle surface areas before discharging the runoff. Additionally, 50% TSS removal in post-development runoff from replaced impervious areas must be achieved prior to discharging the runoff if no prior TSS removal is provided. The site proposes two (2) bioretention systems and several other pervious pavement areas, each of which provides 80% TSS removal for their tributary areas. Nearly all of the proposed motor vehicle surface for the project is tributary to one of these features. The remaining small percentage of motor vehicle surface that bypasses these systems due to constraints with matching existing grades is tributary to the existing extended detention basin and/or bioretention basin, which each provide TSS removal per the previously approved designs. These treatment techniques achieve 80% TSS removal for all new impervious areas on the site and thus meet the water quality requirements.

4.3 Groundwater Recharge

The NJDEP Stormwater Management Regulations require that a proposed land development site comply with either of the following groundwater recharge requirements:

1. Demonstrate that 100% of the site's average annual pre-developed groundwater recharge volume will be maintained after development; or
2. Demonstrate that 100 percent of the difference between the site's pre-development and post-development 2-year runoff volume is infiltrated.

Additionally, NJAC § 7:8-5.4(a)2 states that the groundwater recharge requirement does not apply to projects within the urban redevelopment area nor projects where recharge would be inconsistent with a remedial action work plan.

There will be an increase in impervious surfaces because of the proposed development. Typically, this would result in a slight decrease in groundwater recharge volume compared to the existing condition. However, as required by NJDEP's Stormwater Management Rules, soil testing was performed which concluded that the soil types in the area of the development are classified as primarily clay, with permeability results of less than 0.2 inches per hour. While the mapped soil types are classified as Hydrologic Soil Group (HSG) C, the observed soil conditions are more indicative of HSG D due to the low permeability rates. When groundwater recharge is calculated using the observed soil type, the existing groundwater recharge volume is maintained in the proposed condition, and therefore complies with NJDEP regulations.

4.4 Soil Erosion and Sediment Control

The Soil Erosion and Sediment Control plans and details are included within the Site Plan documents prepared by Bohler Engineering and must be followed throughout construction. Silt fences, stabilized construction entrances, a temporary stockpile and inlet filters are proposed during construction. This report and the Site Plan documents prepared by Bohler Engineering are being submitted to the Somerset-Union Conservation District for approval.

4.5 Low-Impact Development and Non-Structural Stormwater Management Facilities

In accordance with the NJDEP regulations and the latest *New Jersey Stormwater Best Management Practices Manual*, several non-structural stormwater management strategies have been incorporated into the design of the site and are listed below:

4.5.1 Vegetation and Landscaping

A comprehensive Landscape Plan has been incorporated into the design of the proposed improvements on the site that provides low maintenance landscaping. The use of lawn areas has been minimized where applicable and fertilizers and pesticides are to be used sparingly.

4.5.1.1 Vegetative Filters and Buffers

Vegetative filters and buffers are used as part of the proposed design to intercept sheet flow from impervious areas to help increase the time of concentration and provide some water quality treatment prior to entering the proposed stormwater conveyance system. These vegetative filters and buffers differ from the vegetative filter strips described in Section 3.2 above in that they do not meet the requirements to achieve 60%-80% TSS removal but still provide some inherent benefit to the treatment of stormwater runoff. These buffer areas are not part of the calculated water treatment methodology used on site.

4.5.2 Minimize Land Disturbance

The proposed design of the site incorporates the preservation of existing vegetative areas that will remain undisturbed. The undisturbed areas will be protected during construction and will have easements and/or deed restrictions established as required by other NJDEP regulations and permits to ensure these areas remain undisturbed in the future

4.5.3 Impervious Area Management

Impervious areas are the primary source of additional runoff in the post-development site condition. The sections below describe the measures that have been taken in the proposed site design to minimize the amount of impervious proposed on site.

4.5.3.1 Streets, Sidewalks, and Parking, Driveway Areas

As part of the proposed site design, the minimum allowable parking and drive aisle sizes, in accordance with local ordinances, are used in lieu of larger stalls and aisles to reduce the amount of impervious surface in the post-development condition. Additionally, porous pavement areas are proposed where possible to minimize the connected impervious surface on the site.

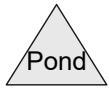

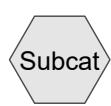

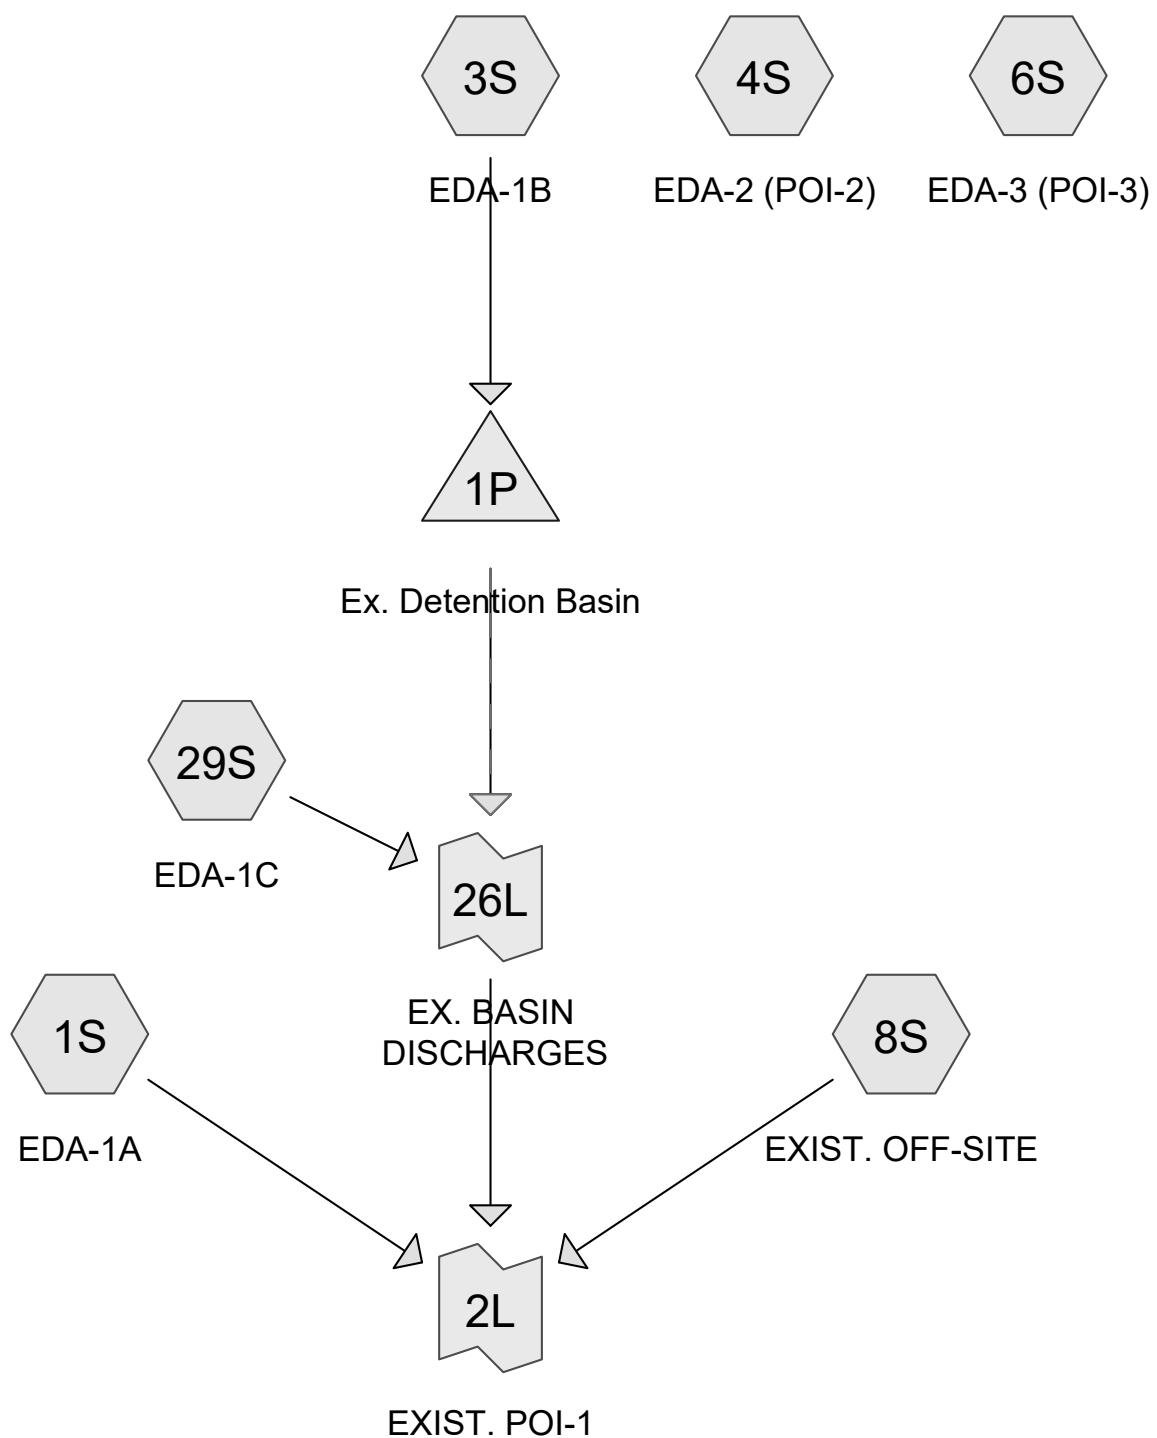

5. Conclusions

As demonstrated in the above sections, the stormwater management plan for the proposed development meets the *NJDEP Stormwater Management Regulations* of March 2021, and addresses the requirements for stormwater quantity reductions, water quality, groundwater recharge, soil erosion and sediment control, and low impact development. As a result of the design calculations contained herein, Bohler Engineering anticipates that the stormwater design will not have a negative impact to surrounding areas.

Hydrograph

Conduit Outlet Protection Calculations

Rip Rap Pad # **1**

Design Parameters:

Design Storm Flow for 25 Year, Q
 Vertical Dimension of Outlet Pipe, D_o
 Horizontal Dimension of Outlet Pipe, W_o
 Tailwater Depth, TW^1

3.40 cfs
15 in
15 in
1.39 ft

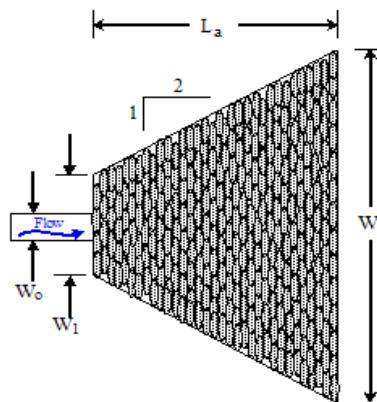

Apron Dimension Calculations:

Unit Ditchage, $q = Q/W_o = 2.72 \text{ cfs per foot}$

- **Case I: $TW < 1/2 D_o$**

$$\begin{aligned} \text{Apron Length, } L_a &= \frac{1.8q}{D_o^{1/2}} + 7D_o = \\ \text{Width, } W_1 &= 3W_o = \\ \text{Width, } W_2 &= 3W_o + L_a = \end{aligned}$$

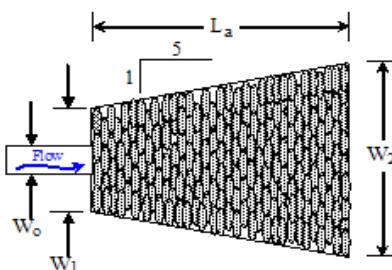

$L_a :$
 $W_1 =$
 $W_2 =$

- **Case II: $TW \geq 1/2 D_o$**

$$\begin{aligned} \text{Apron Length, } L_a &= \frac{3q}{D_o^{1/2}} = 7.3 \text{ ft} \\ \text{Width, } W_1 &= 3W_o = 3.75 \text{ ft} \\ \text{Width, } W_2 &= 3W_o + 0.4L_a = 6.67 \text{ ft} \end{aligned}$$

or **$L_a : 8 \text{ ft}$**
 or **$W_1 = 6 \text{ ft}$**
 or **$W_2 = 7 \text{ ft}$**

Rip Rap Stone Size Calculations:

$$\text{Median Stone, } d_{50} = \frac{0.02q^{1.33}}{TW} = 0.65 \text{ in}$$

$d_{50} : 6 \text{ in}$

Notes:

1. Where there is a well-defined channel downstream of the apron, the bottom width of the apron shall be at least equal to the bottom width of the channel and the structural lining shall extend at least one foot above the tailwater elevation, but no lower than two-thirds of the vertical conduit dimension above the conduit invert.
2. The side slopes shall be 2:1 or flatter.
3. The bottom grade shall be 0.0% (level).
4. There shall be no overfall at the end of the apron or at the end of the culvert.
5. Fifty (50) percent by weight of the rip-rap mixture shall be smaller than the median size stone designated as d_{50} . The largest stone size in the mixture shall be 1.5 times the d_{50} size. The rip-rap shall be reasonably well graded.
6. The thickness of the rip-rap apron may be two (2) times the median stone diameter provided that the apron is constructed on a bedding of four (4) inches of 3/4 inch clean stone on approved filter fabric material.
7. Rip-rap and filter fabric shall meet the standards of the governing Soil Conservation District as well as the requirements of the local municipality.
8. No bends or curves at the intersection of the conduit and apron will be permitted.

Footnote:

1. Tailwater depth shall be the 2 year storm if discharging into a detention basin. For areas where tailwater cannot be computed, use $TW = 0.2D_o$.
2. For multiple pipes, increase rip-rap sizes by 25% when pipe spacing is greater than or equal to $1/4W_o$.

Conduit Outlet Protection Calculations

Rip Rap Pad # 2

Design Parameters:

Design Storm Flow for 25 Year, Q
 Vertical Dimension of Outlet Pipe, D_o
 Horizontal Dimension of Outlet Pipe, W_o
 Tailwater Depth, TW^1

4.63 cfs
 14 in
 23 in
 1.86 ft

Apron Dimension Calculations:

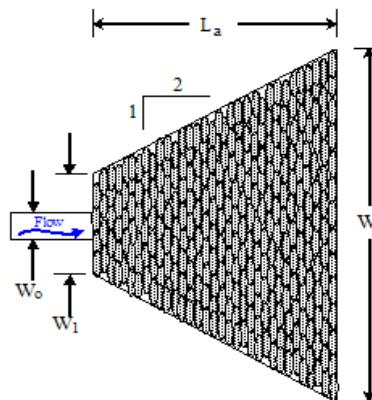

Unit Diccharge, $q = Q/W_o = 2.42$ cfs per foot

- Case I: $TW < 1/2 D_o$

$$\text{Apron Length, } L_a = \frac{1.8q}{D_o^{1/2}} + 7D_o =$$

Width, $W_1 = 3W_o =$
 Width, $W_2 = 3W_o + L_a =$

$L_a :$
 $W_1 =$
 $W_2 =$

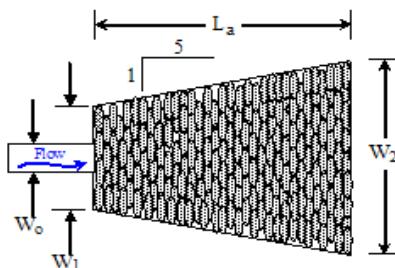

- Case II: $TW \geq 1/2 D_o$

$$\text{Apron Length, } L_a = \frac{3q}{D_o^{1/2}} = 6.71 \text{ ft}$$

Width, $W_1 = 3W_o = 5.75 \text{ ft}$
 Width, $W_2 = 3W_o + 0.4L_a = 8.43 \text{ ft}$

or $L_a : 7 \text{ ft}$
 or $W_1 = 6 \text{ ft}$
 or $W_2 = 9 \text{ ft}$

Rip Rap Stone Size Calculations:

Unit Diccharge, $q = Q/D_o = 3.97$ cfs per foot

$$\text{Median Stone, } d_{50} = \frac{0.02q^{1.33}}{TW} = 0.42 \text{ in}$$

$d_{50} : 6 \text{ in}$

Notes:

- Where there is a well-defined channel downstream of the apron, the bottom width of the apron shall be at least equal to the bottom width of the channel and the structural lining shall extend at least one foot above the tailwater elevation, but no lower than two-thirds of the vertical conduit dimension above the conduit invert.
- The side slopes shall be 2:1 or flatter.
- The bottom grade shall be 0.0% (level).
- There shall be no overfall at the end of the apron or at the end of the culvert.
- Fifty (50) percent by weight of the rip-rap mixture shall be smaller than the median size stone designated as d_{50} . The largest stone size in the mixture shall be 1.5 times the d_{50} size. The rip-rap shall be reasonably well graded.
- The thickness of the rip-rap apron may be two (2) times the median stone diameter provided that the apron is constructed on a bedding of four (4) inches of 3/4 inch clean stone on approved filter fabric material.
- Rip-rap and filter fabric shall meet the standards of the governing Soil Conservation District as well as the requirements of the local municipality.
- No bends or curves at the intersection of the conduit and apron will be permitted.

Footnote:

- Tailwater depth shall be the 2 year storm if discharging into a detention basin. For areas where tailwater cannot be computed, use $TW = 0.2D_o$.
- For multiple pipes, increase rip-rap sizes by 25% when pipe spacing is greater than or equal to $1/4W_o$.

Version 2.0
November 2003

Annual Groundwater Recharge Analysis (based on GSR-32)

Project Name: L'Oreal Franklin			
Description: Building Expansion			
Analysis Date: 10/06/21			
Post-Developed Conditions			
Land Segment	Area (acres)	TR-55 Land Cover	Soil
1	1.18	Woods	Alluvial Land
2	0.03	Open space	Alluvial Land
3	4.1	Open space	Alluvial Land
4	6.73	Impervious areas	Alluvial Land
5	0.87	Woods	Alluvial Land
6	2.33	Open space	Alluvial Land
7	9.15	Woods	Alluvial Land
8	5.19	Impervious areas	Alluvial Land
9	0		
10	0		
11	0		
12	0		
13	0		
14	0		
15	0		
Total =	29.6	Total Annual Recharge (in)	Total = 29.6
	0.0	-	Annual Recharge Requirements Calculation ↓
			% of Pre-Developed Annual Recharge to Preserve = 100%
			Total Impenetrable Area (sq ft) 825,462
			Total Annual Recharge (in)
			Annual Recharge Deficit= 0 (cubic feet)
			Recharge Efficiency Parameters Calculations (area averages)
			DRWC= 0.00 (in) DRWC= 0.00 (in)
			ERWC = 0.00 (in) EDRCW = 0.00 (in)

Procedure to fill the Pre-Development and Post-Development Conditions Tables

For each land segment, first enter the area, then select TR-55 Land Cover, then select Soil from the top of the table and proceed downward. Don't leave blank rows (with A=0) in between your segment entries. Rows with A=0 will not be displayed or used in calculations. For impervious areas outside of standard lots select "Impervious Areas" as the Land Cover. Soil type for impervious areas are only required if an infiltration facility will be built within these areas.

NJDEP Nonstructural Strategies Points System (NSPS)**Version:** January 31, 2006**Note:** Input Values in Yellow Cells Only

Project:	JM210708
Date:	October 11, 2021
User:	MB
Notes:	[REDACTED]

Step 1 - Provide Basic Major Development Site InformationA. Specify Total Area in Acres of Development Site Described in Steps 2 and 3 = 29.6 Acres

B. Specify by Percent the Various Planning Areas Located within the Development Site:

State Plan Planning Area:	PA-1	PA-2	PA-3	PA-4	PA-4B	PA-5	Total % Area
Percent of Each Planning Area within Site:		100.0%					100.0%

Note: See User's Guide for Equivalent Zones within Designated Centers and the NJ Meadowlands, Pinelands, and Highlands Districts

Step 2 - Describe Existing or Pre-Developed Site Conditions

A. Specify Existing Land Use/Land Cover Descriptions and Areas:

Site Segment	Land Use/Land Cover Description	Specify Land Use/Land Cover in Acres for Each HSG				Points
		HSG A	HSG B	HSG C	HSG D	
1	Wetlands and Undisturbed Stream Buffers	0.0	6.5	0.0	0.0	0
2	Lawn and Open Space	51	0.0	0.0	0.0	51
3	Brush and Shrub	0	0.0	0.0	0.0	0
4	Meadow, Pasture, Grassland, or Range	0	0.0	0.0	0.0	0
5	Row Crop	0	0.0	0.0	0.0	0
6	Small Grain and Legumes	0	0.0	0.0	0.0	0
7	Woods - Indigenous	112	11.2	0.0	0.0	122
8	Woods - Planted	0	0.0	0.0	0.0	0
9	Woods and Grass Combination	0	0.0	0.0	0.0	0
10	Ponds, Lakes, and Other Open Water	0	0.0	0.0	0.0	0
11	Gravel and Dirt	0.1	0.1	0.0	0.0	0
12	Porous and Permeable Paving	0	0.0	0.0	0.0	0
13	Directly Connected Impervious	11.8	11.8	0.0	0.0	0
14	Unconnected Impervious with Small D/S Previous	0	0.0	0.0	0.0	0
15	Unconnected Impervious with Large D/S Previous	0	0.0	0.0	0.0	0
HSG Subtotals (Acres):		0.0	0.0	29.6	0.0	29.6
HSG Subtotals (%):		0.0%	0.0%	100.0%	0.0%	100.0%
				Total Area:	29.6	
				Total % Area:	100.0%	
				Points Subtotal:	173	
				Total Existing Site Points:	173	

Step 3 - Describe Proposed or Post-Developed Site Conditions

A. Specify Proposed Land Use/Land Cover Descriptions and Areas:

Site Segment	Land Use/Land Cover Description	Use/Cover				Points
		HSG A	HSG B	HSG C	HSG D	
1	Wetlands and Undisturbed Stream Buffers				0.0	0
2	Lawn and Open Space		7.9		7.9	62
3	Brush and Shrub			0.0	0.0	0
4	Meadow, Pasture, Grassland, or Range			0.0	0.0	0
5	Row Crop			0.0	0.0	0
6	Small Grain and Legumes			0.0	0.0	0
7	Woods - Indigenous	0.7		0.7	0.7	8
8	Woods - Planted	2.1		2.1	2.1	21
9	Woods and Grass Combination			0.0	0.0	0
10	Ponds, Lakes, and Other Open Water			0.0	0.0	0
11	Gravel and Dirt	0.1		0.1	0.1	0
12	Porous and Permeable Paving	0.3		0.3	0.3	2
13	Directly Connected Impervious		18.5		18.5	0
14	Unconnected Impervious with Small D/S Pervious				0.0	0
15	Unconnected Impervious with Large D/S Pervious				0.0	0
HSG Subtotals (Acres):		0.0	0.0	29.6	0.0	29.6
HSG Subtotals (%):		0.0%	0.0%	100.0%	0.0%	100.0%
						Total Area: 100.0%

Points Subtotal:

B. Compare Proposed Impervious Coverage with Maximum Allowable Impervious Coverage:

Total Directly Connected Impervious Coverage = 63%
Total Unconnected Impervious Coverage with Small D/S Pervious = 0%
Total Unconnected Impervious Coverage with Large D/S Pervious = 0%
Total Site Impervious Coverage = 63%
Effective Site Impervious Coverage = 63%

Specify Source of Maximum Allowable Impervious Coverage:

Table (None or Table)

Allowable Site Impervious Cover from Maximum Impervious Cover Table:
Note: See Maximum Impervious Cover Table Worksheet for Details

72%

Points Subtotal: 6

C. Compare Proposed Site Disturbance with Maximum Allowable Site Disturbance:

Total Proposed Site Disturbance =
Maximum Allowable Site Disturbance by Municipal Ordinance =

34%
100%

Points Subtotal: 30

D. Describe Proposed Runoff Conveyance System:

Total Length of Runoff Conveyance System = 2812 Feet
Length of Vegetated Runoff Conveyance System = 190 Feet
% of Total Runoff Conveyance System That is Vegetated = 7%

Points Subtotal: 6

E. Residential Lot Clustering:

Percent of Total Site Area that will be Clustered =
Minimum Standard Lot Size as Per Zoning (Note: 1/2 Acre or Greater) = Acres
Maximum Proposed Cluster Lot Size (Note: 1/4 Acre or Less) = Acres
Percent of Clustered Portion of Site to be Preserved as Vegetated Open Space = % of Clustered Site Portion

Points Subtotal: 0

F. Will the Following be Utilized to Minimize Soil Compaction?

Proposed Lawn Areas will be Graded with Lightweight Construction Equipment:
Percent of Proposed Lawn Areas to be Graded with Such Equipment:

<input type="checkbox"/> Yes	(Yes or No)
<input checked="" type="checkbox"/> 100%	% of Lawn Areas

Points Subtotal: 23

G. Are Any of the Following Stormwater Management Standards Met Using Only Nonstructural Strategies and Measures?

Groundwater Recharge Standards (NJAC 7:8-5.4-a-2);
Stormwater Runoff Quality Standards (NJAC 7:8-5.5);
Stormwater Runoff Quantity Standards (NJAC 7:8-5.4-a-3);

<input type="checkbox"/> No	(Yes or No)
<input checked="" type="checkbox"/> Yes	(Yes or No)
<input type="checkbox"/> No	(Yes or No)

Points Subtotal: 55

Note: If the Answers to All Three Questions at G Above are "Yes", Adequate Nonstructural Measures have been Utilized.

Total Proposed Site Points: 214

Ratio of Proposed to Existing Site Points: 123%

Required Site Points Ratio: 95%

Nonstructural Point System Results:

Proposed Nonstructural Measures are Adequate
