EXECUTIVE SUMMARY

SITE DESCRIPTION

The project area is comprised of Lot 39.05, Block 502.02 in the Township of Franklin in Somerset County, New Jersey. The property is located at the intersection of Davidson Avenue and Franklin Square Drive. The subject parcel consists of an existing mixed-use warehouse, manufacturing and office building. The site presently contains 128,895 SF (2.96 AC.) of impervious coverage. Stormwater runoff from the existing development primarily drains via overland flow and the existing stormwater infrastructure to a manhole located at the southwest corner of the property.

The existing conditions of the tract have been verified by the Boundary and Topographic Survey, as prepared by Dynamic Survey, LLC, dated 05/10/2018, last revised 05/29/2018.

PROJECT DESCRIPTION

The proposed development includes the expansion of the existing mixed-use building with associated roadways, utilities, lighting, and other site improvements. The proposed development will result in a total amount of impervious coverage of 183,562 SF (4.21 AC). Please note the proposed improvements include and expand upon the previously approved building addition scope; existing conditions will be considered the site prior to the building addition approval. The total disturbance area is 3.58 AC. The project includes new stormwater management facilities to address applicable aspects of the Township of Franklin Ordinance and NJAC 7:8.

I. INTRODUCTION

This report has been prepared to define and analyze the stormwater drainage conditions that would occur as a result of the redevelopment of Lot 39.05, Block 502.02 in the Township of Franklin in Somerset County, New Jersey. The proposed development includes the expansion of a mixed warehouse, manufacturing and office use.

This Stormwater Management Study identifies and describes the manner by which the design and performance measures set forth by NJAC 7:8 and the Township of Franklin Ordinance are achieved to minimize the adverse impact of stormwater runoff quantity and quality in receiving water bodies and groundwater recharge into subsurface soils. The scope of the study includes the structures, associated driveways and roadways, landscaping, stormwater collection system, underground detention basin,

aboveground bioretention basin, and other associated improvements as shown on the accompanying engineering drawings.

Based upon the scope of the project, the development is classified as a major development as it disturbs more than one (1) acre of land and increases the amount of impervious coverage onsite by more than ¼ acre; therefore, the project has been designed to meet the groundwater recharge, stormwater runoff quantity and quality standards set forth under NJAC 7:8. Accordingly, the following items are addressed within this report:

- Non-structural stormwater management strategies (7:8-5.3)
- Erosion control, groundwater recharge and runoff quantity standards (7:8-5.4)
- Stormwater runoff quality standards (7:8-5.5)
- Calculation of stormwater runoff (7:8-5.6)
- Standards for structural stormwater management measures (7:8-5.7)

A hydrological evaluation is provided for the 2-, 10- and 100-year storm events utilizing the Urban Hydrology for Small Watershed TR-55 method. The TR-55 method is utilized to design the proposed underground detention basin facility.

The NJDEP flow reduction requirements are as follows:

2-year:	50% reduction
10-year:	25% reduction
100-year:	20% reduction

It is also the intention of the design of this facility to comply with the Stormwater Management Best Management Practices.

II. EXISTING SITE CONDITIONS

The existing lot contains a mix of pervious and impervious surfaces including structures, driveways, sidewalks, landscaping and other site amenities.

The existing conditions of the tract have been verified by the Boundary and Topographic Survey, as prepared by Dynamic Survey, LLC, dated 05/10/2018, last revised 05/29/2018. This information has been utilized to establish an Existing Conditions Drainage Area Map which is included within the Appendix of this Report.

The tract has been evaluated with the following existing drainage sub-watershed areas:

Study Area Davidson Avenue: This portion of the tract consists of a small pervious area in the southeastern corner of the site. The stormwater runoff from this study area currently drains to Davidson Avenue and the existing infrastructure within the Right-of-Way.

Study Area Lot 42.01: This portion of the tract consists of a small pervious area along the western property line. The stormwater runoff from this study area currently drains to existing infrastructure on Lot 42.01.

Study Area Site: This portion of the tract consists of much of Lot 39.05. It includes the vast majority of green space on the site as well as all of the pavement area. The stormwater runoff from this study area currently drains via overland flow to the existing stormwater infrastructure that is either within the site limits or just outside of the property boundaries. This runoff is ultimately tributary to an existing storm manhole in the southwestern corner of the site.

Study Area Roof: This portion of the tract consists of the roof runoff from the existing mixed use building. Runoff from this study area is also ultimately tributary to the existing storm manhole in the southwestern corner of the site. Therefore, it will be combined with “Study Area Site” when comparing pre vs. post development storm events onsite.

Based on Somerset County soils survey information and infiltration tests conducted onsite by Dynamic Earth, LLC, the soil types native to the site include:

SOMERSET COUNTY SOIL SURVEY INFORMATION		
SOIL TYPE (SYMBOL)	SOIL TYPE (NAME)	HYDROLOGIC SOIL GROUP
PenB	Penn Silt Loam, 2 to 6% slopes	C
RehA	Reaville Silt Loam, 0 to 2% slopes	C

III. PROPOSED SITE CONDITIONS

The proposed development includes a 12,000 SF (first-floor footprint) building addition to the existing mixed use building. Additional site improvements include new asphalt parking and drive aisle areas, associated landscaping, lighting and stormwater management facilities.

The tract has been evaluated with the following drainage sub-watershed areas as depicted on the Proposed Conditions Drainage Area Map:

Study Area Davidson Avenue: This portion of the tract consists of a small pervious area in the southwestern corner of the site. The stormwater runoff from this study area drains to Davidson Avenue and the existing infrastructure within the Right-of-Way.

Study Area Lot 42.01: This portion of the tract consists of a small pervious area along the western property line. The stormwater runoff from this study area currently drains to existing infrastructure on Lot 42.01.

Study Area Site: This portion of the tract includes a majority of the site, including the parking lot as well as a mix of impervious and pervious surfaces. The stormwater runoff from this study area drains via overland flow into the existing and proposed stormwater infrastructure onsite. This runoff is ultimately tributary to an existing storm manhole in the southwestern corner of the site.

Study Area Site Undetained: This portion of the tract includes much of the pervious area in the southern and eastern portions of the site, as well as portions of the site driveways. The stormwater runoff from this study area drains via overland flow or into the proposed stormwater management pipe network into the existing stormwater infrastructure within Franklin Square Drive or along the rear of the property. This runoff is ultimately tributary to the existing storm manhole in the southwestern corner of the site and, therefore, will be combined with “Study Area Site” when comparing pre vs. post development storm events onsite.

Study Area Roof: This portion of the tract consists of the roof runoff from the existing mixed use building and proposed addition. Runoff from this study area is ultimately tributary to the existing storm manhole in the southwestern corner of the site. Therefore, it will be combined with “Study Area Site” when comparing pre vs. post development storm events onsite.

IV. DESIGN METHODOLOGY

In order to prepare the stormwater management, water quality and groundwater recharge design for the subject project, an investigation of the property and topography was performed. On-site review of the tract was initially performed by Dynamic Engineering Consultants, PC to verify existing site conditions and land cover characteristics. Dynamic Survey, LLC, was contracted to prepare a Boundary and Topographic survey for the existing site.

Furthermore, Dynamic Earth, LLC performed test pits within the site to establish the seasonal high water table.

Based on our review of the existing site conditions and survey, the drainage area maps for the existing site conditions as defined within this report were established. A grading plan was developed for the proposed site improvements with consideration to the existing drainage patterns. The plan was designed to ensure that runoff from the proposed development could be directed to stormwater management facilities in order to address the applicable sections of NJAC 7:8 and the Township Ordinance.

Stormwater runoff from the majority of the proposed development is collected by the proposed on-site stormwater collection system and routed to the proposed underground detention basin or aboveground bioretention basin. Stormwater runoff from the previously approved building addition and existing roof is routed through the roof leader conveyance system and bypasses the proposed detention system. However, the new proposed building addition roof runoff is routed directly to the underground detention basin; bypassing

the Contech Peak Diversion Stormfilters. The detention basin is tributary to the existing stormwater manhole in the southwestern corner of the property. The underground detention basin has been designed to detain and release stormwater runoff at a controlled rate via the outlet control structure in order to meet the runoff quantity reduction standards set forth by NJAC 7:8-5.4 and the Township of Franklin Land Use Ordinance. Before entering the underground basin, the newly constructed and existing resurfaced asphalt parking area onsite is treated by one of the two Contech Peak Diversion Stormfilters to meet runoff quality standards set forth by NJAC 7:8-5.5. Stormwater runoff from the new parking area proposed to the north of the building is to be conveyed to the aboveground bioretention along the Franklin Square right-of-way. The bioretention basin is designed to detain the water quality design storm runoff and outlet exclusively via an underdrain to meet runoff quality standards set forth by NJAC 7:8-5.5. The stormwater runoff from the underground detention basin and aboveground bioretention basin stormwater are also tributary to the existing stormwater manhole in the southwestern corner of the property.

The Stormwater Management standards in NJAC 7:8-5.5 require stormwater management measures that are designed to reduce the post-construction load of TSS in stormwater generated from the NJDEP water quality storm by 80% of the anticipated load from the developed site for sites that increase the amount of impervious coverage by one-quarter (0.25) acre. The proposed development increases impervious coverage by 54,667 SF (1.25 Ac); therefore, the proposed stormwater system has been designed to treat the stormwater runoff generated by the NJDEP Water Quality Design Storm by utilizing a Contech Peak Diversion Stormfilter. The NJDEP Water Quality Storm is defined as a 1.25 inch, 2-hour variable rate rainfall event.

Dynamic Earth, LLC was contracted to perform stormwater management test pits in order to confirm the infiltration capabilities of the subsurface soils onsite. A copy of their findings can be found appended to this report. Two (2) basin flood tests were performed in the area of the proposed detention basin to confirm whether or not infiltration could be utilized in this basin area. One of the test pits did not drain within 24 hours and the other pit provided an infiltration rate of 0.5 in/hr. Per the New Jersey BMP Manual, neither of these tests yielded results that would allow for infiltration at the proposed detention basin.

The overall stormwater management design for the subject tract has been prepared by Dynamic Engineering Consultants to ensure that the overall development satisfies the standards set forth in the Township of Franklin Ordinance, and NJAC 7:8.

V. RUNOFF RATE REDUCTION PERFORMANCE

Pre-Development and Post Development Peak Runoff Results
Summary – Overall Site

DESIGN STORM	EX. UNDISTURBED PEAK FLOW (CFS)	EX. DISTURBED PEAK FLOW (CFS)	REDUCTION (%)	REDUCED DISTURBED PEAK FLOW ALLOWABLE (CFS)	TOTAL ALLOWABLE PEAK FLOW (CFS)	TOTAL PROPOSED PEAK FLOW (CFS)

10 Year	0.399	0.111	0.288
100 Year	0.858	0.238	0.62

VI. UNDERGROUND DETENTION BASIN

As previously stated within this report, the stormwater management design utilizes an underground detention basin and a proposed underground conveyance pipe system to satisfy the stormwater quantity and quality regulations set forth by the Township of Franklin Land Development Ordinance and the NJDEP. Stormwater runoff from the proposed underground detention basin will be released at a controlled rate through an outlet control structure in order to satisfy the stormwater runoff quantity regulations. Stormwater runoff from the basin will ultimately be discharged to the existing stormwater conveyance system in the southwest corner of the site.

VII. ABOVEGROUND BIORETENTION BASIN

As previously stated within this report, the stormwater management design utilizes an aboveground detention basin and a proposed underground conveyance pipe system to satisfy the stormwater quantity and quality regulations set forth by the Township of Franklin Land Development Ordinance and the NJDEP. The aboveground bioretention basin is capable of detaining the entire water quality design storm volume, as is required by the New Jersey Best Management Practices for small scale bioretention basins. Underdrains are proposed below the basin to route any excess runoff through the proposed outlet control structure. All storm runoff greater than the water quality storm peak elevation will be released at a controlled rate through an outlet control structure in order to satisfy the stormwater runoff quantity regulations. Stormwater runoff from the basin will ultimately be discharged to the existing stormwater conveyance system in the southwest corner of the site.

VIII. WATER QUALITY

The TSS removal rate requirement set forth by the Township of Franklin Land Use Ordinance and NJAC 7:45 is 80% for new/reconstructed pavement and 0% for areas that are milled and overlaid to the previously existing grade. Roof runoff that is collected is considered “clean” and does not require any TSS removal.

There is 91,287 SF of new and reconstructed impervious coverage proposed onsite (including banked parking areas). Therefore, the equivalent of 80% TSS removal must be provided for this area of the site.

The stormwater management design for the project satisfies the water quality requirement by utilizing two (2) Contech Peak Diversion Stormfilter manufactured treatment device and an extended detention basin certified to provide a TSS removal rate of 40.00%.

To provide a weighted calculation of the required TSS removal rate for both treated and untreated areas for the total site, the underground detention basin has been designed to use the combined treatment train of extended detention and a water quality treatment unit that has been approved by the NJDEP to achieve 80% TSS removal. The proposed detention basin has been designed for a TSS removal rate of 40.00%. The combined TSS removal rate for stormwater tributary to treatment train from both underground basin detention time and the Contech Stormfilter manufactured treatment devices is 88.0%. The bioretention basin functions completely independent of the Stormfilter and extended detention system, and therefore has a separate TSS removal rate of 80% when constructed in accordance with the NJDEP BMP. There is 4,744 SF of new impervious driveway area that will not be collected and treated by the basin, therefore providing 0% TSS removal rate. The clean runoff from the proposed roof area will also be routed to the proposed underground basin, where it will receive the additional benefit of TSS removal due to extended detention. For the purposes of this exercise, that runoff will not be included in the tabulation for required TSS removal. The weighted average for proposed TSS removal proposed is calculated below:

Treated Runoff by MTD & Extended Detention = 77,400 SF

Treated Runoff by Bioretention Basin = 9,143 SF

Untreated Runoff = 4,744 SF

$$\textit{Provided TSS RE}m\textit{oval Rate} = \frac{(77,400 \textit{ SF} \times 88.0\%) + (9,143 \textit{ SF} \times 80\%) + (4,744 \textit{ SF} \times 0\%)}{91,287 \textit{ SF}} = 82.63\%$$

Since the provided TSS removal rate (82.63%) is greater than the required rate (80%), the TSS obligation onsite has been met. Calculations of both the detention time TSS removal rate as well as the NJDEP Certification Letter and sizing requirements for the Stormfilter MTD have been provided within the appendix of this report.

IX. GROUNDWATER RECHARGE

As was mentioned previously, two (2) basin flood tests were conducted in accordance with the NJ BMP manual in the area of the proposed detention basin due to the fact that bedrock was encountered between 6

and 8 feet below existing ground surface. The results yielded data that did not support infiltration as only one test pit drained within 24 hours. The infiltration rate that can be applied to the drained test pit is 0.5 in/hour. Previous field explorations in other areas of the site have yielded very similar subsurface makeups, with refusal of testing equipment between 6 and 8 feet below surface elevation. It is assumed that this condition exists in all areas of the site, including pervious areas that are being paved over as part of this proposed development. Thus, the groundwater recharge requirement does not apply.

X. CONCLUSION

The proposed development has been designed with provisions for the safe and efficient control of stormwater runoff in a manner that will not adversely impact the existing drainage patterns, adjacent roadways, or adjacent parcels. The proposed drainage design complies with the requirements outlined in the Township of Franklin Ordinance and NJAC 7:8. With this stated, it is evident the proposed development will not have a negative impact on the existing drainage patterns, stormwater runoff quantity, water quality or groundwater recharge on-site or within the vicinity of the subject parcel.

11

Hydroflow Hydrographs by Intelisolve v9.1

Friday, Dec 2, 2022

Hyd. No. 5

Post Route To Basin

Hydrograph type = Reservoir
 Storm frequency = 1 yrs
 Time interval = 5 min
 Inflow hyd. No. = 4 - Prop DA Basin Total
 Reservoir name = UG Basin

Peak discharge = 0.179 cfs
 Time to peak = 125 min
 Hyd. volume = 7,115 cuft
 Max. Elevation = 57.50 ft
 Max. Storage = 6,370 cuft

Storage indication method used.

Pond Report

Hydralflow Hydrographics by Inletsolve v9.1

Friday, Dec 2, 2022

Pond No. 1 - UG Basin

UG Chambers - Invert elev. = 55.50 ft., Rise x Span = 4.00 x 4.00 ft., Barrel Len = 98.00 ft., No. Barrels = 10., Slope = 0.25%, Headers = Yes

UNDERGROUND DETENTION SCHEMATIC

- NOTES:
1. BASIN CONSTRUCTION MUST NOT OVER COMPACT OR SMEAR SOILS BELOW BASIN BOTTOM.
 2. OWNER SHALL CONTACT AND ENGAGE DYNAMIC EARTH, LLC. TO TEST SOIL PERMEABILITY AND PROVIDE CONSTRUCTION PHASE INSPECTIONS OF THE BASIN BOTTOM SOILS AND FILL MATERIALS WITHIN ANY PROPOSED INFILTRATION OR RETENTION BASIN TO COMPARE RESULTS TO DESIGN CRITERIA. CONTRACTOR SHALL CONTACT DYNAMIC EARTH AT (908) 879-7095 (WWW.DYNAMIC-EARTH.COM) AT ONSET OF PROJECT TO CONFIRM REQUIREMENTS AND COORDINATE INSPECTIONS.

48" RCP SCHEMATIC UNDERGROUND BASIN DETAIL

NOT TO SCALE

**EXTENDED DETENTION BASIN TSS REMOVAL
RATE CALCULATIONS**

Detention Basin Detention Time and TSS Removal Calculations

Based on the NJDEP Best Management Practices, the TSS removal rate for an extended detention basin is based on the basin's detention time. The detention time begins when the maximum storage volume is achieved and ends when only 10% of the maximum volume remains.

Based on the following numerical hydrograph discharge table, the maximum storage volume in the proposed basin for the Water Quality storm occurs at basin storage elevation 57.50, which corresponds to a maximum volume of 6,336 CF based on the stage-storage of the proposed basin. Accordingly, the 10% peak volume is 634 CF, which occurs at the basin storage elevation of 55.98.

Based on the following numerical hydrograph discharge table, the maximum storage volume occurs at time 125 minutes and the 10% volume occurs at time 845 minutes. Therefore, the total detention time is:

$$t = 845 \text{ minutes} - 125 \text{ minutes} = 720 \text{ minutes} = 12.00 \text{ hours}$$

The total TSS removal is given by the following equation:

$$\% \text{ TSS Removal Rate} = 40 + \left\{ \left[\frac{t-12}{12} \right] \times 20 \right\}$$

Where t is the time of detention in hours and $12 \leq t \leq 24$

Therefore, the total TSS removal rate is:

$$\% \text{ TSS Removal Rate} = 40 + \{ [0] \times 20 \} = 40.00 \%$$

TSS REMOVAL RATE FOR BMPS IN SERIES

TSS Removal Rate for BMP's in Series

Project: Odin Pharmaceuticals
 Job #: 2137-99-001
 Location: Franklin Township, NJ

Computed By: KO
 Checked By: MJB
 Date: 12/2/2022

Note: This spreadsheet has been prepared in accordance with Chapter 4 of the New Jersey Best Management Practices Manual

In such cases, the total removal rate of the BMP treatment train is based on the removal rate of the second BMP applied to the fraction of the TSS load remaining after the runoff has passed through the first BMP (Massachusetts DEP, 1997).

A simplified equation for the total TSS removal rate (R) for two BMPs in series is:

$$R = A + B - [(A \times B) / 100] \text{ (Equation 4-1)}$$

Where:

R = Total TSS Removal Rate

A = TSS Removal Rate of the First or Upstream BMP

B = TSS Removal Rate of the Second or Downstream BMP

Proposed Stormwater Management System

The proposed stormwater management facility consists of a

A-	Manufactured Treatment Device
TSS Removal Rate*	80 %

* From Total Suspended Solids Removal Rate of Extended Detention Basin Calculation Spreadsheet

B-	Extended Detention Basin w/ a 12.00 hr Detention Time
TSS Removal Rate =	40 %

R (Total TSS Removal Rate - Utilizing Equation 4-1) = **88.00 %**

**STORMWATER COLLECTION SYSTEM

**NJDEP 80% TSS REMOVAL CERTIFICATION FOR THE
CONTECH PEAK DIVERSION STORMFILTER
8'x22' Stormfilter & 8'x16' Stormfilter**

Odin Pharmaceuticals (North StormFilter)

Franklin, NJ
4/11/22

Information Provided by Engineer (Dynamic Engineering):

- Required TSS removal rate = 80%
- Pervious drainage area = 4,100 SF
- Impervious Area = 27,072 SF
- Presiding agency = DRCC

Information Determined by Contech:

- Attenuated WQ flow rate = 1.103 cfs

StormFilter Information and Cartridge Data:

The Stormwater Management StormFilter[®] is a passive, siphon-actuated, flow-through stormwater filtration system consisting of a precast concrete structure that houses rechargeable, media-filled filter cartridges. The StormFilter works by passing stormwater through the media-filled cartridges, which trap particulates and adsorb pollutants such as dissolved metals, nutrients, and hydrocarbons. **The StormFilter has received final certification from the NJDEP for 80% TSS removal as a stand-alone treatment system.**

- StormFilter cartridge filter media = Perlite
- StormFilter cartridge media height = 18 inches (nominal)
- StormFilter cartridge surface area = 7.07 square feet (nominal)
- StormFilter cartridge specific treatment flow rate = 2.12 gallons/minute per square foot (nominal)
- StormFilter cartridge treatment flow = 15 gpm
- **Hydraulic head required = 2.00 feet** (with 18 inch cartridge)
- Minimum physical drop between inlet and outlet pipe = 6 inches

Design Summary:

The StormFilter is sized based on the NJDEP certification, which lists an approved treatment flow rate and maximum impervious acreage limit per cartridge in Table 1. The number of cartridges required based on the impervious drainage area is compared with the number of cartridges required based on the treatment flowrate; the larger number of cartridges governs the sizing.

The StormFilter for this site was sized to provide **33 cartridges** in order to meet the hydraulic load requirement (calculations shown below). To house this number of cartridges, Contech Engineered Solutions recommends an 8'x16' precast Peak Diversion StormFilter vaults.

$$N_{\text{cartridges}}^{\text{Hyd.load}} = \frac{Q_{\text{treat}} \times 449 \text{ gpm/cfs}}{Q_{\text{cartridge}}} = \frac{1.103 \text{ cfs} \times 448.83 \text{ gpm/cfs}}{15 \text{ gpm/cartridge}} = 33.00 \Rightarrow (33) \text{ 18" Cartridges}$$

$$N_{\text{cartridges}}^{\text{Mass load}} = \frac{\text{Area}_{\text{site}}}{\text{Max Area}_{\text{cartridge}}} = \frac{0.621 \text{ acre}}{0.09 \text{ acres/cartridge}} = 6.90 \Rightarrow (7) \text{ 18" Cartridges}$$

StormFilter Design Summary

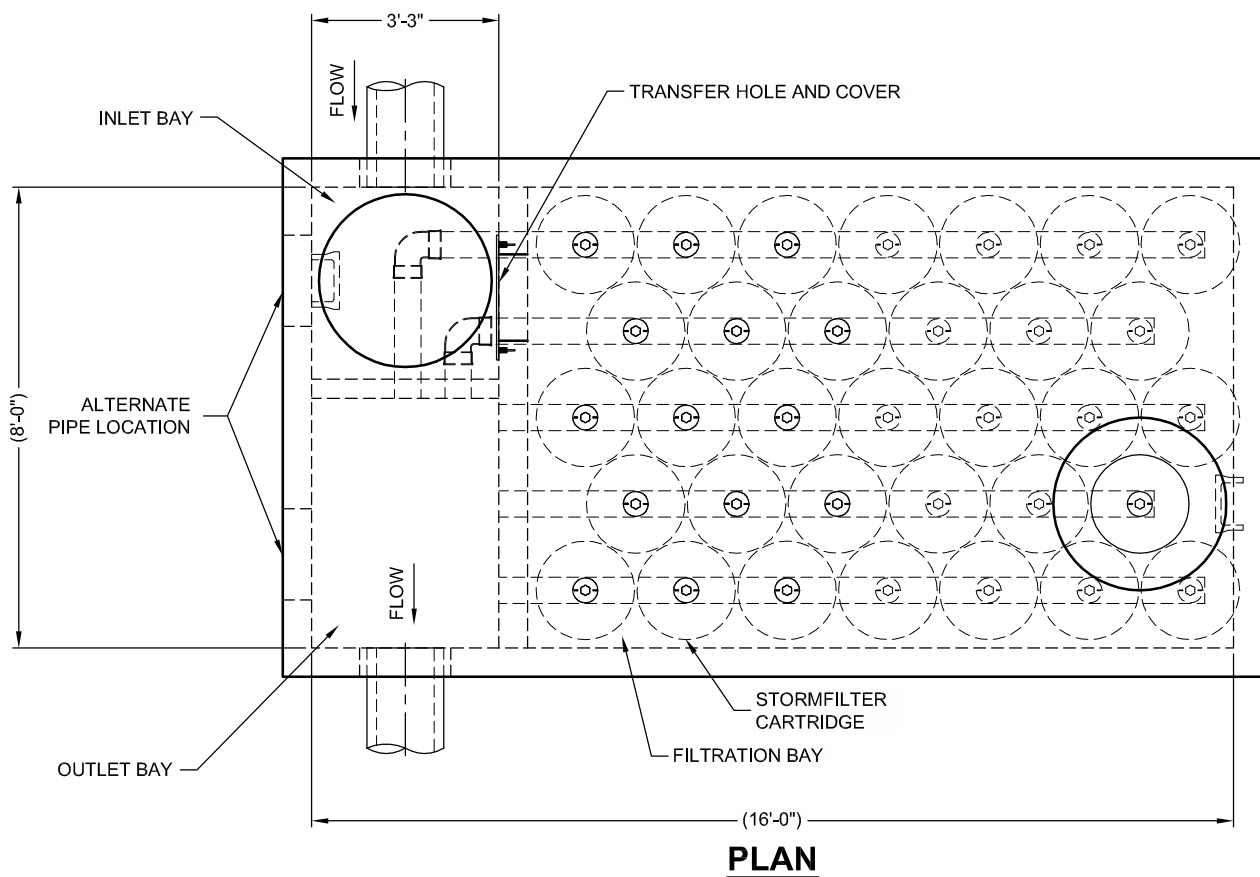

Maintenance:

Maintenance of Stormwater best management practices is required per the New Jersey Administrative Code 7:8-5.8. Recommendations for maintenance are included in chapters 8 & 9 of the New Jersey Stormwater Best Management Practices Manual. To comply with requirements, CONTECH offers a network of Preferred Service Providers that have the capability to perform all necessary inspections, compliance reporting and cleaning services. CONTECH recommends inspecting the system annually and maintaining the system at the recommendation of the annual inspection. Full maintenance is typically required every 24-36 months. Disposal of material should be handled in accordance with local regulations. Please contact CONTECH's Maintenance Department for all questions regarding maintenance at (503) 258-3157 or visit our website at www.contech-cpi.com/maintenance.

Thank you for the opportunity to present this information to you and your client.

Sincerely,

Taylor Murdock

Re: MTD Laboratory Certification
Stormwater Management StormFilter® (StormFilter) by Contech Engineered Solutions LLC
Off-line Installation

TSS Removal Rate 80%

Dear Mr. Berg:

The Stormwater Management rules under N.J.A.C. 7:8-5.5(b) and 5.7(c) allow the use of manufactured treatment devices (MTDs) for compliance with the design and performance standards at N.J.A.C. 7:8-5 if the pollutant removal rates have been verified by the New Jersey Corporation for Advanced Technology (NJCAT) and have been certified by the New Jersey Department of Environmental Protection (NJDEP). Contech Engineered Solutions LLC has requested a Laboratory Certification for the StormFilter System.

This project falls under the "Procedure for Obtaining Verification of a Stormwater Manufactured Treatment Device from New Jersey Corporation for Advanced Technology" dated January 25, 2013. The applicable protocol is the "New Jersey Department of Environmental Protection Laboratory Protocol to Assess Total Suspended Solids Removal by a Filtration Manufactured Treatment Device" dated January 25, 2013.

NJCAT verification documents submitted to the NJDEP indicate that the requirements of the aforementioned protocol have been met or exceeded. The NJCAT letter also included a recommended certification TSS removal rate and the required maintenance plan. The NJCAT Verification Report with the Verification Appendix for this device is published online at <http://www.njcat.org/verification-process/technology-verification-database.html>.

The NJDEP certifies the use of the StormFilter System by Contech Engineered Solutions LLC at a TSS removal rate of 80%, when designed, operated and maintained in accordance with the information provided in the Verification Appendix and subject to the following conditions:

1. The maximum treatment flow rate (MTFR) for the manufactured treatment device (MTD) is calculated using the New Jersey Water Quality Design Storm (1.25 inches in 2 hrs) in N.J.A.C. 7:8-5.5. The MTFR is calculated based on a verified loading rate of 2.12 gpm/sf of effective filtration treatment area.
2. The StormFilter System shall be installed using the same configuration as the unit tested by NJCAT, and sized in accordance with the criteria specified in item 6 below.
3. This device cannot be used in series with another MTD or a media filter (such as a sand filter), to achieve an enhanced removal rate for total suspended solids (TSS) removal under N.J.A.C. 7:8-5.5.
4. Additional design criteria for MTDs can be found in Chapter 9.6 of the New Jersey Stormwater Best Management Practices (NJ Stormwater BMP) Manual which can be found on-line at www.njstormwater.org.
5. The maintenance plan for a site using this device shall incorporate, at a minimum, the maintenance requirements for the StormFilter, which is attached to this document. However, it is recommended to review the maintenance website at <http://www.conteches.com/DesktopModules/Bring2mind/DMX/Download.aspx?EntryId=2813&PortalId=0&DownloadMethod=attachment> for any changes to the maintenance requirements.
6. Sizing Requirements:

The example below demonstrates the sizing procedure for a StormFilter System.

Example: A 0.25 acre impervious site is to be treated to 80% TSS removal using a StormFilter System. The impervious site runoff (Q) based on the New Jersey Water Quality Design Storm was determined to be 0.79 cfs or 354.58 gpm.

The calculation of the minimum number of cartridges for use in the StormFilter System is based upon both the MTFR and the maximum inflow drainage area. It is necessary to calculate the required cartridges using both methods and to rely on the method that results in the highest minimum number of cartridges determined by the two methods.

Inflow Drainage Area Evaluation:

The drainage area to the StormFilter System in this example is 0.25 acres. Based upon the information in Table 1 below, the following minimum number of cartridges are required in a StormFilter System to treat the impervious area without exceeding the maximum drainage area:

1. Five (5) 12” cartridges,
2. Three (3) 18” cartridges, or
3. Two (2) 27” cartridges

Maximum Treatment Flow Rate (MTFR) Evaluation:

The site runoff (Q) was determined based on the following:

time of concentration = 10 minutes
 $i=3.2$ in/hr (page 5-8, Fig. 5-3 of the NJ Stormwater BMP Manual)
 $c=0.99$ (runoff coefficient for impervious)
 $Q=ciA=0.99 \times 3.2 \times 0.25 = 0.79$ cfs = 0.79×448.83 gpm = 354.58 gpm

Based on a flow rate of 354.58 gpm, the following minimum number of cartridges are required in a StormFilter System to treat the impervious area without exceeding the MTFR:

1. Thirty-six (36) 12” cartridges,
2. Twenty-four (24) 18” cartridges, or
3. Sixteen (16) 27” cartridges

The MTFR Evaluation results will be used since that method results in the higher minimum number of cartridges determined by the two methods.

The sizing table corresponding to the available system models are noted below:

TABLE 1 STORMFILTER CARTRIDGE HEIGHTS AND NEW JERSEY TREATMENT CAPACITIES

StormFilter Cartridge Heights and New Jersey Treatment Capacities				
StormFilter Cartridge Height	Filtration Surface Area (sq.ft)	MTFR ¹ (GPM)	Mass Capture Capacity (lbs)	Maximum Allowable Inflow Area ² (acres)
Low Drop (12")	4.71	10	36.3	0.061
18"	7.07	15	54.5	0.09
27"	10.61	22.5	81.8	0.136

Notes:

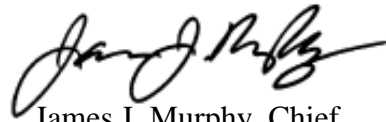

1. MTFR calculated based on 4.72×10^{-3} cfs/sf (2.12 gpm/sf) of effective filtration treatment area.
2. Based upon the equation found in the NJDEP Filter Protocol Maximum Inflow Drainage Area (acres) = weight of TSS before 10% loss in MTFR (lbs)/600 lbs/acre of drainage area annually.

Be advised a detailed maintenance plan is mandatory for any project with a Stormwater BMP subject to the Stormwater Management Rules, N.J.A.C. 7:8. The plan must include all of the items identified in Stormwater Management Rules, N.J.A.C. 7:8-5.8. Such items include, but are not limited to, the list of

indication of problems in the system, and training of maintenance personnel. Additional information can be found in Chapter 8: Maintenance and Retrofit of Stormwater Management Measures.

If you have any questions regarding the above information, please contact Shashi Nayak of my office at (609) 633-7021.

Sincerely,

A handwritten signature in black ink, appearing to read "James J. Murphy". The signature is fluid and cursive, written over a white background.

James J. Murphy, Chief
Bureau of Nonpoint Pollution Control

Shashi Nayak, NJDEP - BNPC

Odin Pharmaceuticals (South StormFilter)

Franklin, NJ

4/11/22

Information Provided by Engineer (Dynamic Engineering):

- Required TSS removal rate = 80%
- Pervious drainage area = 9,770 SF
- Impervious Area = 47,653 SF
- Presiding agency = DRCC

Information Determined by Contech:

- Attenuated WQ flow rate = 1.604 cfs

StormFilter Information and Cartridge Data:

The Stormwater Management StormFilter[®] is a passive, siphon-actuated, flow-through stormwater filtration system consisting of a precast concrete structure that houses rechargeable, media-filled filter cartridges. The StormFilter works by passing stormwater through the media-filled cartridges, which trap particulates and adsorb pollutants such as dissolved metals, nutrients, and hydrocarbons. **The StormFilter has received final certification from the NJDEP for 80% TSS removal as a stand-alone treatment system.**

- StormFilter cartridge filter media = Perlite
- StormFilter cartridge media height = 18 inches (nominal)
- StormFilter cartridge surface area = 7.07 square feet (nominal)
- StormFilter cartridge specific treatment flow rate = 2.12 gallons/minute per square foot (nominal)
- StormFilter cartridge treatment flow = 15 gpm
- **Hydraulic head required = 2.00 feet** (with 18 inch cartridge)
- Minimum physical drop between inlet and outlet pipe = 6 inches

Design Summary:

The StormFilter is sized based on the NJDEP certification, which lists an approved treatment flow rate and maximum impervious acreage limit per cartridge in Table 1. The number of cartridges required based on the impervious drainage area is compared with the number of cartridges required based on the treatment flowrate; the larger number of cartridges governs the sizing.

The StormFilter for this site was sized to provide **48 cartridges** in order to meet the hydraulic load requirement (calculations shown below). To house this number of cartridges, Contech Engineered Solutions recommends an 8'x22' precast Peak Diversion StormFilter.

$$N_{\text{cartridges}}^{\text{Hyd.load}} = \frac{Q_{\text{treat}} \times 449 \text{ gpm/cfs}}{Q_{\text{cartridge}}} = \frac{1.604 \text{ cfs} \times 448.83 \text{ gpm/cfs}}{15 \text{ gpm/cartridge}} = 47.99 \Rightarrow (48) \text{ 18" Cartridges}$$

$$N_{\text{cartridges}}^{\text{Mass load}} = \frac{\text{Area}_{\text{site}}}{\text{Max Area}_{\text{cartridge}}} = \frac{1.09 \text{ acre}}{0.09 \text{ acres/cartridge}} = 12.16 \Rightarrow (13) \text{ 18" Cartridges}$$

StormFilter Design Summary

Maintenance:

Maintenance of Stormwater best management practices is required per the New Jersey Administrative Code 7:8-5.8. Recommendations for maintenance are included in chapters 8 & 9 of the New Jersey Stormwater Best Management Practices Manual. To comply with requirements, CONTECH offers a network of Preferred Service Providers that have the capability to perform all necessary inspections, compliance reporting and cleaning services. CONTECH recommends inspecting the system annually and maintaining the system at the recommendation of the annual inspection. Full maintenance is typically required every 24-36 months. Disposal of material should be handled in accordance with local regulations. Please contact CONTECH's Maintenance Department for all questions regarding maintenance at (503) 258-3157 or visit our website at www.contech-cpi.com/maintenance.

Thank you for the opportunity to present this information to you and your client.

Sincerely,

Taylor Murdock
Contech Engineered Solutions LLC

STORMFILTER DESIGN NOTES

- THE 8' x 22' PEAK DIVERSION STORMFILTER TREATMENT CAPACITY VARIES BY CARTRIDGE COUNT AND LOCALLY APPROVED SURFACE AREA SPECIFIC FLOW RATE. PEAK CONVEYANCE CAPACITY TO BE DETERMINED BY ENGINEER OF RECORD.
- THE PEAK DIVERSION STORMFILTER IS AVAILABLE IN A LEFT INLET (AS SHOWN) OR RIGHT INLET CONFIGURATION.
- ALL PARTS AND INTERNAL ASSEMBLY PROVIDED BY CONTECH UNLESS OTHERWISE NOTED.

PERFORMANCE SPECIFICATION

FILTER CARTRIDGES SHALL BE MEDIA-FILLED, PASSIVE, SIPHON ACTUATED, RADIAL FLOW, AND SELF CLEANING. **RADIAL MEDIA DEPTH SHALL BE 7-INCHES.** FILTER MEDIA CONTACT TIME SHALL BE AT LEAST **38 SECONDS.** SPECIFIC FLOW RATE SHALL BE **2 GPM/SF (MAXIMUM).** SPECIFIC FLOW RATE IS THE MEASURE OF THE FLOW (GPM) DIVIDED BY THE MEDIA SURFACE CONTACT AREA (SF). MEDIA VOLUMETRIC FLOW RATE SHALL BE **6 GPM/CF OF MEDIA (MAXIMUM).**

GENERAL NOTES

1. CONTECH TO PROVIDE ALL MATERIALS UNLESS NOTED OTHERWISE.
2. DIMENSIONS MARKED WITH () ARE REFERENCE DIMENSIONS. ACTUAL DIMENSIONS MAY VARY.
3. FOR FABRICATION DRAWINGS WITH DETAILED STRUCTURE DIMENSIONS AND WEIGHTS, PLEASE CONTACT YOUR CONTECH REPRESENTATIVE. www.contechES.com
4. STORMFILTER WATER QUALITY STRUCTURE SHALL BE IN ACCORDANCE WITH ALL DESIGN DATA AND INFORMATION CONTAINED IN THIS DRAWING. CONTRACTOR TO CONFIRM STRUCTURE MEETS REQUIREMENTS OF PROJECT.
5. STRUCTURE SHALL MEET AASHTO HS20 LOAD RATING, ASSUMING EARTH COVER OF 0' - 5' AND GROUNDWATER ELEVATION AT, OR BELOW, THE OUTLET PIPE INVERT ELEVATION. ENGINEER OF RECORD TO CONFIRM ACTUAL GROUNDWATER ELEVATION. CASTINGS SHALL MEET AASHTO M306 AND BE CAST WITH THE CONTECH LOGO.

INSTALLATION NOTES

- A. ANY SUB-BASE, BACKFILL DEPTH, AND/OR ANTI-FLOTATION PROVISIONS ARE SITE-SPECIFIC DESIGN CONSIDERATIONS AND SHALL BE SPECIFIED BY ENGINEER OF RECORD.
- B. CONTRACTOR TO PROVIDE EQUIPMENT WITH SUFFICIENT LIFTING AND REACH CAPACITY TO LIFT AND SET THE STORMFILTER STRUCTURE (LIFTING CLUTCHES PROVIDED).
- C. CONTRACTOR TO INSTALL JOINT SEALANT BETWEEN ALL SECTIONS AND ASSEMBLE STRUCTURE.
- D. CONTRACTOR TO PROVIDE, INSTALL, AND GROUT PIPES. MATCH OUTLET PIPE INVERT WITH OUTLET BAY FLOOR.
- E. CONTRACTOR TO TAKE APPROPRIATE MEASURES TO PROTECT CARTRIDGES FROM CONSTRUCTION-RELATED EROSION RUNOFF.
- F. CONTRACTOR TO REMOVE THE TRANSFER HOLE COVER WHEN THE SYSTEM IS BROUGHT ONLINE.

Re: MTD Laboratory Certification
Stormwater Management StormFilter® (StormFilter) by Contech Engineered Solutions LLC
Off-line Installation

TSS Removal Rate 80%

Dear Mr. Berg:

The Stormwater Management rules under N.J.A.C. 7:8-5.5(b) and 5.7(c) allow the use of manufactured treatment devices (MTDs) for compliance with the design and performance standards at N.J.A.C. 7:8-5 if the pollutant removal rates have been verified by the New Jersey Corporation for Advanced Technology (NJCAT) and have been certified by the New Jersey Department of Environmental Protection (NJDEP). Contech Engineered Solutions LLC has requested a Laboratory Certification for the StormFilter System.

This project falls under the "Procedure for Obtaining Verification of a Stormwater Manufactured Treatment Device from New Jersey Corporation for Advanced Technology" dated January 25, 2013. The applicable protocol is the "New Jersey Department of Environmental Protection Laboratory Protocol to Assess Total Suspended Solids Removal by a Filtration Manufactured Treatment Device" dated January 25, 2013.

NJCAT verification documents submitted to the NJDEP indicate that the requirements of the aforementioned protocol have been met or exceeded. The NJCAT letter also included a recommended certification TSS removal rate and the required maintenance plan. The NJCAT Verification Report with the Verification Appendix for this device is published online at <http://www.njcat.org/verification-process/technology-verification-database.html>.

The NJDEP certifies the use of the StormFilter System by Contech Engineered Solutions LLC at a TSS removal rate of 80%, when designed, operated and maintained in accordance with the information provided in the Verification Appendix and subject to the following conditions:

1. The maximum treatment flow rate (MTFR) for the manufactured treatment device (MTD) is calculated using the New Jersey Water Quality Design Storm (1.25 inches in 2 hrs) in N.J.A.C. 7:8-5.5. The MTFR is calculated based on a verified loading rate of 2.12 gpm/sf of effective filtration treatment area.
2. The StormFilter System shall be installed using the same configuration as the unit tested by NJCAT, and sized in accordance with the criteria specified in item 6 below.
3. This device cannot be used in series with another MTD or a media filter (such as a sand filter), to achieve an enhanced removal rate for total suspended solids (TSS) removal under N.J.A.C. 7:8-5.5.
4. Additional design criteria for MTDs can be found in Chapter 9.6 of the New Jersey Stormwater Best Management Practices (NJ Stormwater BMP) Manual which can be found on-line at www.njstormwater.org.
5. The maintenance plan for a site using this device shall incorporate, at a minimum, the maintenance requirements for the StormFilter, which is attached to this document. However, it is recommended to review the maintenance website at <http://www.conteches.com/DesktopModules/Bring2mind/DMX/Download.aspx?EntryId=2813&PortalId=0&DownloadMethod=attachment> for any changes to the maintenance requirements.
6. Sizing Requirements:

The example below demonstrates the sizing procedure for a StormFilter System.

Example: A 0.25 acre impervious site is to be treated to 80% TSS removal using a StormFilter System. The impervious site runoff (Q) based on the New Jersey Water Quality Design Storm was determined to be 0.79 cfs or 354.58 gpm.

The calculation of the minimum number of cartridges for use in the StormFilter System is based upon both the MTFR and the maximum inflow drainage area. It is necessary to calculate the required cartridges using both methods and to rely on the method that results in the highest minimum number of cartridges determined by the two methods.

Inflow Drainage Area Evaluation:

The drainage area to the StormFilter System in this example is 0.25 acres. Based upon the information in Table 1 below, the following minimum number of cartridges are required in a StormFilter System to treat the impervious area without exceeding the maximum drainage area:

1. Five (5) 12” cartridges,
2. Three (3) 18” cartridges, or
3. Two (2) 27” cartridges

Maximum Treatment Flow Rate (MTFR) Evaluation:

The site runoff (Q) was determined based on the following:

time of concentration = 10 minutes
 $i=3.2$ in/hr (page 5-8, Fig. 5-3 of the NJ Stormwater BMP Manual)
 $c=0.99$ (runoff coefficient for impervious)
 $Q=ciA=0.99 \times 3.2 \times 0.25 = 0.79$ cfs = 0.79×448.83 gpm = 354.58 gpm

Based on a flow rate of 354.58 gpm, the following minimum number of cartridges are required in a StormFilter System to treat the impervious area without exceeding the MTFR:

1. Thirty-six (36) 12” cartridges,
2. Twenty-four (24) 18” cartridges, or
3. Sixteen (16) 27” cartridges

The MTFR Evaluation results will be used since that method results in the higher minimum number of cartridges determined by the two methods.

The sizing table corresponding to the available system models are noted below:

TABLE 1 STORMFILTER CARTRIDGE HEIGHTS AND NEW JERSEY TREATMENT CAPACITIES

StormFilter Cartridge Heights and New Jersey Treatment Capacities				
StormFilter Cartridge Height	Filtration Surface Area (sq.ft)	MTFR¹ (GPM)	Mass Capture Capacity (lbs)	Maximum Allowable Inflow Area² (acres)
Low Drop (12")	4.71	10	36.3	0.061
18"	7.07	15	54.5	0.09
27"	10.61	22.5	81.8	0.136

Notes:

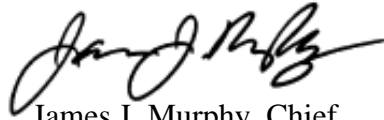

1. MTFR calculated based on 4.72×10^{-3} cfs/sf (2.12 gpm/sf) of effective filtration treatment area.
2. Based upon the equation found in the NJDEP Filter Protocol Maximum Inflow Drainage Area (acres) = weight of TSS before 10% loss in MTFR (lbs)/600 lbs/acre of drainage area annually.

Be advised a detailed maintenance plan is mandatory for any project with a Stormwater BMP subject to the Stormwater Management Rules, N.J.A.C. 7:8. The plan must include all of the items identified in Stormwater Management Rules, N.J.A.C. 7:8-5.8. Such items include, but are not limited to, the list of

indication of problems in the system, and training of maintenance personnel. Additional information can be found in Chapter 8: Maintenance and Retrofit of Stormwater Management Measures.

If you have any questions regarding the above information, please contact Shashi Nayak of my office at (609) 633-7021.

Sincerely,

A handwritten signature in black ink, appearing to read "James J. Murphy".

NJDEP Nonstructural Strategies Points System (NSPS)

Version: January 31, 2006

Note: Input Values in Yellow Cells Only

Project:

Date:

User:

Notes:

Step 1 - Provide Basic Major Development Site Information

A. Specify Total Area in Acres of Development Site Described in Steps 2 and 3 = Acres

B. Specify by Percent the Various Planning Areas Located within the Development Site:

State Plan Planning Area:	PA-1	PA-2	PA-3	PA-4	PA-4B	PA-5	Total % Area
Percent of Each Planning Area within Site:	<input type="text" value="100.0%"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text" value="100.0%"/>

Note: See User's Guide for Equivalent Zones within Designated Centers and the NJ Meadowlands, Pinelands, and Highlands Districts

Step 2 - Describe Existing or Pre-Developed Site Conditions

A. Specify Existing Land Use/Land Cover Descriptions and Areas:

Site Segment	Land Use/Land Cover Description	Specify Land Use/Land Cover in Acres for Each HSG				Use/Cover	Points
		HSG A	HSG B	HSG C	HSG D	Subtotals	
1	Wetlands and Undisturbed Stream Buffers					0.0	0
2	Lawn and Open Space			2.7		2.7	109
3	Brush and Shrub					0.0	0
4	Meadow, Pasture, Grassland, or Range					0.0	0
5	Row Crop					0.0	0
6	Small Grain and Legumes					0.0	0
7	Woods - Indigenous					0.0	0
8	Woods - Planted					0.0	0
9	Woods and Grass Combination					0.0	0
10	Ponds, Lakes, and Other Open Water					0.0	0
11	Gravel and Dirt					0.0	0
12	Porous and Permeable Paving					0.0	0
13	Directly Connected Impervious			3.0		3.0	0
14	Unconnected Impervious with Small D/S Pervious					0.0	0
15	Unconnected Impervious with Large D/S Pervious					0.0	0
HSG Subtotals (Acres):		0.0	0.0	5.7	0.0		Total Area: 5.7
HSG Subtotals (%):		0.0%	0.0%	100.0%	0.0%		Total % Area: 100.0%
							Points Subtotal: 109
							Total Existing Site Points: 109

Step 3 - Describe Proposed or Post-Developed Site Conditions

A. Specify Proposed Land Use/Land Cover Descriptions and Areas:

Site Segment	Land Use/Land Cover Description	Specify Land Use/Land Cover in Acres for Each HSG				Use/Cover	Points
		HSG A	HSG B	HSG C	HSG D	Subtotals	
1	Wetlands and Undisturbed Stream Buffers					0.0	0
2	Lawn and Open Space					0.0	0
3	Brush and Shrub			1.5		1.5	69
4	Meadow, Pasture, Grassland, or Range					0.0	0
5	Row Crop					0.0	0
6	Small Grain and Legumes					0.0	0
7	Woods - Indigenous					0.0	0
8	Woods - Planted					0.0	0
9	Woods and Grass Combination					0.0	0
10	Ponds, Lakes, and Other Open Water					0.0	0
11	Gravel and Dirt					0.0	0
12	Porous and Permeable Paving					0.0	0
13	Directly Connected Impervious			4.1		4.1	0
14	Unconnected Impervious with Small D/S Pervious					0.0	0
15	Unconnected Impervious with Large D/S Pervious					0.0	0
HSG Subtotals (Acres):		0.0	0.0	5.7	0.0		Total Area: 5.7
HSG Subtotals (%):		0.0%	0.0%	100.0%	0.0%		Total % Area: 100.0%
							Points Subtotal: 69

B. Compare Proposed Impervious Coverage with Maximum Allowable Impervious Coverage:

Total Directly Connected Impervious Coverage =	73%	% of Site
Total Unconnected Impervious Coverage with Small D/S Pervious =	0%	% of Site
Total Unconnected Impervious Coverage with Large D/S Pervious =	0%	% of Site
Total Site Impervious Coverage =	73%	% of Site
Effective Site Impervious Coverage =	73%	% of Site

Specify Source of Maximum Allowable Impervious Coverage: Table (None or Table)

Allowable Site Impervious Cover from Maximum Impervious Cover Table: 85%
 Note: See Maximum Impervious Cover Table Worksheet for Details

Points Subtotal: 7

C. Compare Proposed Site Disturbance with Maximum Allowable Site Disturbance:

Total Proposed Site Disturbance =	61%	% of Site
Maximum Allowable Site Disturbance by Municipal Ordinance =	100%	% of Site

Points Subtotal: 18

D. Describe Proposed Runoff Conveyance System:

Total Length of Runoff Conveyance System =	318	Feet
Length of Vegetated Runoff Conveyance System =	0	Feet
% of Total Runoff Conveyance System That is Vegetated =	0%	

Points Subtotal: 0

E. Residential Lot Clustering:

Percent of Total Site Area that will be Clustered =		% of Site
Minimum Standard Lot Size as Per Zoning (Note: 1/2 Acre or Greater) =		Acres
Maximum Proposed Cluster Lot Size (Note: 1/4 Acre or Less) =		Acres
Percent of Clustered Portion of Site to be Preserved as Vegetated Open Space =		% of Clustered Site Portion

Points Subtotal: 0

F. Will the Following be Utilized to Minimize Soil Compaction?

Proposed Lawn Areas will be Graded with Lightweight Construction Equipment:
Percent of Proposed Lawn Areas to be Graded with Such Equipment:

Yes	(Yes or No)
75%	% of Lawn Areas

Points Subtotal: **17**

G. Are Any of the Following Stormwater Management Standards Met Using Only Nonstructural Strategies and Measures?

Groundwater Recharge Standards (NJAC 7:8-5.4-a-2):
Stormwater Runoff Quality Standards (NJAC 7:8-5.5):
Stormwater Runoff Quantity Standards (NJAC 7:8-5.4-a-3):

No	(Yes or No)
No	(Yes or No)
No	(Yes or No)

Points Subtotal: **0**

Note: If the Answers to All Three Questions at G Above are "Yes", Adequate Nonstructural Measures have been Utilized.

Total Proposed Site Points: 110

Ratio of Proposed to Existing Site Points: 101%

Required Site Points Ratio: 74%

Nonstructural Point System Results:

Proposed Nonstructural Measures are Adequate

1.0 SUMMARY OF FINDINGS

Dynamic Earth, LLC (Dynamic Earth) has completed an exploration and evaluation of the subsurface conditions for the proposed site improvements located at 300 Franklin Square Drive in the Township of Franklin, Somerset County, New Jersey. The site is further identified as Block 502.02, Lot 39.05. The subject site is shown on the *Boring and Soil Profile Pit Location Plan*, attached within the appendix of this report.

At the time of Dynamic Earth's investigation, the subject site was developed with an existing two-story masonry building with associated pavement and utilities. The proposed site improvements will include construction of an addition along the western wall of the existing warehouse. The proposed building addition is expected to occupy a footprint area of approximately 18,396 square feet. The site development will also include associated stormwater management facilities, pavement and utilities. The proposed site improvements were provided on a March 17, 2017 *Conceptual Site Plan 'A'*.

The subsurface exploration included reconnaissance of the project site, drilling soil borings, excavating soil profile pits, performing laboratory testing and evaluating the geotechnical conditions relevant to the proposed construction details provided. A summary of Dynamic Earth's findings and recommendations is presented below:

- **Generalized Subsurface Conditions:** Beneath the surface cover (topsoil and asphaltic concrete), existing fill material was encountered that generally consisted of gravel, sand and clay with variable amounts of silt and debris (asphalt, glass, rope and brick). The existing debris was generally encountered within proposed stormwater management facility areas. The existing fill material was encountered to depths ranging between approximately one foot and four feet below the ground surface. Beneath the surficial cover and/or existing fill material, natural residual soils were encountered that generally consisted of gravel (USCS: GP-GM) and sand (USCS: SM) with variable amounts of silt. The natural residual soils were encountered to depths ranging between approximately 2.5 feet and 4.5 feet below the ground surface. Beneath the existing fill material and/or residual soils, weathered rock was encountered that generally consisted of gravel (USCS:GP-GM) and silt (USCS: ML) with variable amounts of sand and clay. The weathered rock/top of rock was encountered to depths ranging between approximately 3.5 feet and 7.5 feet below the ground surface. Seasonal high groundwater and groundwater was not encountered during our investigation. However, soil mottling was encountered to depths ranging between 2.7 feet and 3.2 feet below the ground surface which is likely due to a perched groundwater above the rock stratum.
- **Overexcavation of Existing Fill Material:** Existing fill material was encountered that is not suitable for direct support of proposed foundations without the risk of excessive settlement. As such, these materials will need to be overexcavated and replaced below the

proposed foundations (were encountered). Suitable portions may remain below proposed floor slabs provided that they are properly evaluated during construction, as detailed herein.

- **Foundations:** Following overexcavation of the existing fill material, the proposed building may be supported on conventional shallow foundation bearing within newly placed compacted structural fill material and/or approved residual soils or weathered rock. Foundations may be designed to exert a maximum allowable net bearing pressure of 3,000 pounds per square foot (psf).
- **Floor Slabs:** The majority of the existing fill material is primarily expected to be suitable for support of proposed floor slabs provided these materials are properly evaluated and inspected during construction. **At least partial overexcavation and replacement of the existing fill material should be anticipated beneath the floor slab. In addition, portions of the on-site soils are considered moisture sensitive and partial overexcavation and replacement should be anticipated.**
- **Use of Site Soils as Structural Fill:** The on-site soils are anticipated to be suitable for reuse as structural fill material provided that moisture contents are within tolerable limits to achieve compaction and oversize and deleterious debris (if encountered) is separated. Portions of the on-site soils are considered moisture sensitive and may require moisture conditioning and/or become impractical for reuse if exposed to periods of moisture.
- **Groundwater Control:** Groundwater was encountered deeper than anticipated excavation depths and the need for extensive groundwater control is not expected.

Detailed design criteria and construction recommendations for proposed foundations, floor slabs, stormwater management facilities and related earthwork are discussed in the following report. Dynamic Earth should remain involved to provide consultation and review during final design.

2.0 INTRODUCTION

2.1 Authorization

Dynamic Earth, LLC (Dynamic Earth) was authorized to conduct a geotechnical investigation in accordance with Dynamic Engineering Consulting, PC's proposal to Dr. Veerappan Subramanian of Somerset Therapeutics, LLC.

2.2 Purpose

The purpose of this subsurface exploration and analysis was to:

- ascertain the various soil profile components at test locations;
- estimate the engineering characteristics of the proposed foundation bearing and subgrade materials;
- provide geotechnical criteria for use by the design engineers in preparing the foundations, floor slab and pavement designs;
- provide recommendations for required earthwork and subgrade preparation;
- record seasonal high groundwater and groundwater levels at the time of the investigation and discuss the potential impact on the proposed construction; and
- recommend additional investigation, if warranted.

2.3 Scope

The scope of the exploration and analysis included site geologic research and evaluation, subsurface exploration, field testing and sampling, performing laboratory testing and geotechnical engineering analysis and evaluation of the subsurface materials. This *Report of Geotechnical Investigation* is limited to addressing the site conditions as they relate to the physical support of the proposed construction. Environmental conditions were not evaluated by Dynamic Earth.

2.3.1 Field Exploration

The investigation was conducted by means of seven soil borings (identified as borings B-1 through B-7) and four soil profile pits (identified as SPP-1 through SPP-4). The borings were performed using hollow stem auger drilling techniques with a truck-mounted drill-rig, and the soil profile pits were excavated with a rubber-tired backhoe. Test locations are summarized in the following table and are shown on the accompanying *Boring and Soil Profile Pit Location Plan*.

TEST LOCATION SUMMARY TABLE		
Number	Proposed Location	Final Depth ¹ (feet)
B-1	Warehouse Expansion	6.0
B-2		7.0
B-3		6.5
B-4		5.5
B-5		7.0
B-6		6.5
B-7		7.5
SPP-1	Stormwater Management Facility	4.3
SPP-2		4.8
SPP-3		3.5
SPP-4		4.3

¹Refusal was encountered at each location

The soil borings and soil profile pits were completed in the presence of a Dynamic Earth engineer who performed field tests, recorded visual classifications, and collected samples of the various strata encountered. The test locations were located in the field using conventional taping procedures with estimated right angles, and are presumed to be accurate within several feet of the location plotted on the plans.

Soil borings and standard penetration tests (SPTs) were conducted in general accordance with ASTM D6151 (*Standard Practice for Using Hollow-Stem Augers for Geotechnical Exploration and Soil Sampling*) and ASTM D1586 (*Standard Test Method for Standard Penetration Test and Split Barrel Sampling of Soils*). The SPT resistance value (N) is used extensively in conjunction with many correlations which relate to blow count, or SPT N-value to engineering behavior of soils to develop foundation and earthwork recommendations. Unconfined compressive strength (Q_u) values were assessed with a pocket penetrometer within the fine-grained soils and are correlated with the engineering behavior of soil to develop foundation and earthwork recommendations in fine-grained soils.

The soils encountered within soil profile pits were classified using the United States Department of Agriculture (USDA) classification system. Observations were made for groundwater and/or soil mottling and mineral deposits potentially indicative of zones of saturation or seasonal high groundwater. Soil logs are included in the Appendix of this report.

Groundwater level observations were recorded during and at the completion of field operations prior to backfilling the borings. Seasonal variations, temperature, anthropogenic, seasonality, soil permeability, and precipitation will influence the actual and observed groundwater levels.

Groundwater elevations derived from sources other than seasonally observed groundwater monitoring wells may not be representative of true groundwater levels.

2.3.2 Laboratory Testing Program

Physical/Textural Analysis: Each sample was visually classified in general accordance with ASTM D-2488 (visual-manual procedure). In addition, representative samples of selected strata encountered were subjected to a laboratory testing program which included moisture content determinations (ASTM D-2216), particle size distribution (ASTM D-6913) and washed gradation analyses (ASTM D1140) in order to perform supplementary engineering soil classifications in general accordance with ASTM D-2487. The soil strata tested were classified by the Unified Soil Classification System (USCS) and results of the laboratory testing are summarized in the following table:

PHYSICAL/TEXTURAL RESULTS					
Boring	Sample No.	Depth (feet)	Natural Moisture Content (%)	Percent Passing No. 200 (%)	USCS Classification
B-1	S-2	2-3.2	9.5	79.0	ML
B-7	S-3	4-5.1	9.9	56.0	ML

The engineering classifications are useful when considered in conjunction with the additional site data to estimate properties of the soil types encountered and to predict the soil’s behavior under construction and service loads. Laboratory test results are provided in the appendix identified as *Laboratory Testing*.

3.0 SITE DESCRIPTION

3.1 Location and Description

The subject property is located at 300 Franklin Square Drive in the Township of Franklin, Somerset County, New Jersey and is further identified as Block 502.02, Lot 39.05. The subject site is bound to the north by Franklin Square Drive; to the east by Davidson Avenue; to the south by an existing hotel (Comfort Inn and Suites); and to the west by an existing parking lot part of the adjacent commercial property (Philips Lighting). The site of the proposed construction is shown on the attached *Boring and Soil Profile Pit Location Plan*.

3.2 Existing Conditions

Surface Cover: At the time of Dynamic Earth's investigation, the subject site was developed with an existing two-story masonry building with associated pavement and utilities.

Topography: Topographic information was provided on an April 27, 2018 *Boundary and Topographic Survey* prepared by Dynamic Survey, LLC. Site elevations ranged between 73 feet above mean sea elevation (mse) within the eastern portion of the property and 61 feet above mse within the north eastern and north western portion of the property.

Site Drainage: Surface runoff generally appears to follow existing site topography toward inlet structures located along adjacent roadways. The terminus of the pipes have not been assessed or determined as part of this investigation.

3.3 Proposed Construction

The proposed site improvements are expected to include the construction of an addition to the west of the existing warehouse and is expected to occupy a footprint area of approximately 18,396 square feet. The site development will also include associated stormwater management facilities, pavement and utilities. The proposed site improvements were provided on a March 17, 2017 *Conceptual Site Plan 'A'*.

The maximum anticipated loads were preliminarily assumed based on similar projects and are expected to be as follows:

- wall loads – 2.5 kips per linear foot;
- column loads - 120 kips; and
- floor slab loads - 125 pounds per square foot.

The scope of Dynamic Earth's investigation and the professional advice contained in this report were generated based on the project details and loading noted herein. Any revisions or additions to the design details enumerated in this report should be brought to the attention of Dynamic Earth for additional evaluation as warranted.

4.0 SUBSURFACE CONDITIONS

4.1 Site Geology

The subject property is located within the Piedmont physiographic province of New Jersey and is situated in the Newark Basin Geomorphic Province. Specifically, this area is underlain by the Lower Jurassic and Upper Triassic Passaic Formation, which is predominantly composed of reddish-brown to brownish-purple and grayish-red argillaceous siltstone; silty-mudstone; argillaceous, very-fine-grained sandstone; and shale.

Overburden materials mapped within the subject site include weathered shale, mudstone and sandstone formed during the Pleistocene age. This material generally includes reddish-brown, yellow, and light-grey silty-sand to silty-clay with shale, mudstone or sandstone fragments. Overburden materials also include man-made fills.

4.2 Soil Survey

Based on a review of the United States Department of Agriculture – Natural Resources Conservation Services (USDA-NRCS) soil survey the following soil resources are mapped underlying the site within the area of the proposed site improvements and are described below:

Penn Silt Loam, two to six percent slopes (PenB): The typical soil profile of this soil series (as reported in the soil survey) consists of silt loam to a depth of 12 inches; channery silt loam to a depth of 25 inches; very channery silt loam to 30 inches; underlain by bedrock (limit of the report). The depth to the groundwater table is reported to be greater than 80 inches below the natural ground surface.

4.3 Subsurface Soil Profile

Details of the subsurface materials encountered are presented on the *Records of Subsurface Exploration* presented in the Appendix of this report. The subsurface soil conditions encountered in the soil borings and soil profile pits were generally consistent with the subsurface conditions mapped for the site and consisted of the following generalized strata in order of increasing depth.

Surface Cover: Soil borings were performed within existing pavement and landscape areas. Tests performed within existing pavement areas encountered one inch to 3.5 inches of asphaltic concrete at the surface. Tests performed within existing landscape areas encountered two inches to eight inches of topsoil at the surface.

Existing Fill Material: Beneath the surface cover, existing fill material was encountered that generally consisted of gravel, sand and clay with variable amounts of silt and debris. The debris encountered included asphalt, glass, rope and brick. The existing debris was generally encountered within proposed stormwater management facility areas. The existing fill material was encountered to depths ranging between approximately one foot and four feet below the ground surface. A Standard Penetration Test (SPT) N-value of six blows per foot (bpf) was encountered within the coarse-grained soils. An unconfined compressive strength (Q_p) pocket penetration test value of 0.25 tons per square foot (tsf) was recorded within the fine-grained soils.

Residual Soils: Beneath the surficial cover and/or existing fill material, natural residual soils were encountered that generally consisted of gravel (USCS: GP-GM) and sand (USCS: SM) with variable amounts of silt. The natural residual soils were encountered to depths ranging between approximately 2.5 feet and 4.5 feet below the ground surface. SPT N-values ranged between 24 bpf and 30 bpf, and averaged 27 bpf; generally indicating a medium dense condition.

Weathered Rock/Top of Rock: Beneath the existing fill material and/or residual soils, weathered rock was encountered that generally consisted of gravel (USCS:GP-GM) and silt (USCS: ML) with variable amounts of sand and clay. The weathered rock was encountered to depths ranging between approximately 3.5 feet and 7.5 feet below the ground surface. Split spoon sampler refusal was generally encountered within this stratum, indicating a very dense condition. Auger refusal is anticipated to be the top of rock.

4.4 Seasonal High Groundwater and Groundwater

Seasonal high groundwater and groundwater were not encountered during our investigation. However, soil mottling was encountered to depths ranging between approximately 2.7 feet and 3.2 feet below the ground surface. The soil mottling is likely due to a perched groundwater above the rock stratum. Groundwater levels are expected to fluctuate seasonally, and following significant periods of precipitation.

5.0 CONCLUSIONS AND RECOMMENDATIONS

5.1 General

Proposed foundations are expected to bear partially within existing fill material and partially within natural material, residual soils and/or weathered rock. The existing fill material is not suitable for direct foundation support without the risk of excessive settlement. Dynamic Earth recommends overexcavating the existing fill material (were encountered) below proposed foundations and replacement with approved compacted structural fill material. Following overexcavation and replacement, the proposed building may be supported on a conventional shallow foundation system bearing within structural fill material or approved natural residual soils and/or weathered rock. The existing fill material is preliminarily anticipated to be suitable for support of the proposed floor slab, provided the material is properly inspected by a Dynamic Earth geotechnical engineer as detailed herein.

The recommendations presented herein are sufficient to support the initial design and planning phase. These recommendations are contingent on the assumption that Dynamic Earth will remain involved in the final design process and that Dynamic Earth will be engaged to conduct the necessary construction phase geotechnical testing and inspection to ensure these recommendations are properly implemented.

5.2 Site Preparation and Earthwork

Surface Cover Stripping: Prior to stripping operations, all utilities should be identified and secured. The surface cover materials, including vegetation and topsoil, should be removed from within, and at least five feet beyond, the limits of the proposed building and new pavement areas as well as any other area which will require fill placement. Removal of trees should include root mats and tree stumps.

Surface Preparation/Proofrolling: Prior to placing any fill or subbase materials to raise or restore grades to the desired building pad or pavement subgrade elevations, the existing exposed soils should be compacted to a firm and unyielding surface with several passes in two perpendicular directions with a vibratory, smooth drum roller during favorable moisture conditions. The drum roller should be operated in the static mode or a kneading “sheepsfoot” roller should be used if fine-grained soils (such as within the existing fill layer) are encountered at the subgrade elevation. The surface then should be proofrolled with a loaded tandem axle truck in the presence of Dynamic Earth to help identify soft or loose pockets which may require removal and replacement or further investigation. Dynamic Earth anticipates at least partial overexcavation if the subgrade is wetted or subjected to repeated construction traffic. Any fill or backfill should be placed and compacted in accordance with Section 5.3.

Subgrade Protection and Inspection: Portions of the on-site soils are considered moisture sensitive and every effort should be made to minimize disturbance of the on-site soils by construction traffic and surface runoff. The on-site soils with higher amounts of silt and clay will likely become unsuitable if exposed to moisture and/or construction traffic. Therefore, the subgrades should be sealed daily and construction traffic be minimized to designated non-structural areas and following periods of precipitation as an attempt to minimize deterioration of otherwise suitable subgrade soils. If these materials become overly wetted, the on-site soils may require increased handling such as discing and drying during extended periods of favorable weather and/or partial overexcavation and geogrid stabilization. A triaxial geogrid such as Tensor TX5 or TX7, may be used for excessively soft or pumping conditions as directed by the geotechnical engineer. Dynamic Earth should be retained as the Geotechnical Engineer of Record to inspect soil conditions during construction and verify the suitability of prepared foundation, floor slab and pavement subgrades for support of design loads.

Difficult Excavation: Difficult auger advancement and auger refusal was encountered at depths as shallow as 3.5 feet below the ground surface. Depending on final invert elevations, difficult excavation to remove cobbles/boulders and/or weathered rock should be anticipated during construction.

While small boulder and cobble sized rock may typically be removed with conventional excavation equipment, heavy excavating equipment with rock ripping tools may be required for larger boulders and/or to remove only the uppermost weathered rock. The speed and ease of excavation will depend on the type of grading equipment, the skill of the equipment operators, and the geologic structure of the material itself, such as the direction of bedding, planes of weakness, and spacing between discontinuities. Planned excavation depths beyond refusal depths will likely require pneumatic hammers to remove the rock.

Earthwork during Freezing Weather: When temperatures fall below freezing for periods of time, the moisture within the soil matrix will freeze. Fine grained soils have a higher susceptibility to frost than well drained granular soils and could freeze at fast rates. Frost susceptible soils will often become unstable once they thaw, even if the material is properly placed and compacted. As such, special construction methods, additional handling and/or construction sequencing should be planned when weather forecasts predict periods of freezing ambient air temperatures. **Fill and subbase material should not be placed on water, snow, ice, or frozen soil.** Subgrade materials that freeze will need to be removed and replaced with suitable structural fill material prior to placement of subsequent fill layers, subbase material and/or surficial cover material as detailed throughout this report. Frozen soils are not suitable for placement as structural fill material and generally need to be exported from the site, unless construction schedules allow for stockpiling and drying of these materials during warmer weather. The contractor should be responsible for

including budgetary rates for earthwork during periods of potential freezing weather and for protection against freezing subgrades.

5.3 Structural Fill and Backfill

Import/On-site Structural Fill Material: Soils placed as structural fill material should consist of well graded sand or gravel with a maximum particle size of three inches in diameter and less than 15 percent of material passing the number 200 sieve. These materials should be free of objectionable debris (clay clumps, organic and/or deleterious material, etc.) and within moisture contents suitable for compaction. Alternative soil types with higher percentages of silt and clay may be considered, provided that the contractor is able to achieve proper compaction and maintain suitable subgrade once the material is placed. Fine-grained soils and/or granular soils with higher percentages of silt and clay are extremely moisture sensitive and will only be suitable for reuse as structural fill material during ideal weather conditions. Materials that are wetted beyond the optimum moisture content; contain oversized rock or debris; and/or contain increased amounts of objectionable debris will not be suitable for reuse as structural fill material without special handling. As such, the contractor should be responsible for importing structural fill material and/or processing on-site soils as required so that these materials are suitable for structural fill placement.

If encountered cobbles/boulders and oversized debris greater than three inches in diameter will need to be separated from on-site soils to be placed as structural fill. Approved material between three to 12 inches in diameter may be crushed or individually placed in fill layers deeper than two feet below proposed subgrade levels. Care must be taken to individually seat any large particles and to compact soil around large particles with hand operated equipment to minimize the risk of void formation. The larger material should not be placed near areas of the proposed utility or planned excavation. Boulders larger than approximately 12 inches are not expected to be adequate for use as fill or backfill and should be removed from the site or crushed to an adequate size.

The on-site soils encountered included existing fill material, residual soils, weathered rock and rock. The on-site soils are preliminarily expected to be suitable for reuse as structural fill material, provided moisture contents are within tolerable limits to achieve compaction and oversized and deleterious debris is separated. In addition, portions of these materials are considered moisture sensitive and may require moisture conditioning and/or become impractical for reuse if exposed to periods of moisture. Reuse of the on-site soils will be contingent upon further evaluation during construction.

Compaction and Placement Requirements: Structural fill and backfill should be placed in maximum 12 inch loose lifts and compacted to 95 percent of the maximum dry density as determined by ASTM D1557 (Modified Proctor). Variations in moisture content may be acceptable subject to Dynamic Earth's on site geotechnical engineer's approval if the contractor is

able to achieve the necessary compaction. Dynamic Earth recommends using a drum roller to compact subgrade soils beneath larger areas such as pavements or slabs. Hand operated vibratory jumping jacks and plate compactors should be used in confined excavations for foundations or utilities. Fill material compacted with relatively light weight equipment or with drum roller in the static mode may require additional passes and/or the material may need to be placed in thinner, loose lifts.

Structural Fill Testing: Before filling operations begin, representative samples of each proposed fill material (on-site and imported) should be collected. The samples should be tested to determine the maximum dry density (ASTM D1557), optimum moisture content (ASTM D1557), natural moisture content (ASTM D2216), gradation (ASTM D6913), and plasticity (ASTM D4318) of the soil. These tests are needed for quality control during compaction and also to determine if the fill material is acceptable. The placement of all fill and backfill should be monitored by Dynamic Earth's geotechnical engineer or technician to ensure that the specified material and lift thicknesses are properly installed. A sufficient number of in-place density tests should be performed during fill placement to ensure that the specified compaction is achieved throughout the area and height of the fill or backfill.

5.4 Groundwater Control

Groundwater levels are expected to be deeper than proposed foundation and utility excavations and the need for extensive dewatering or permanent groundwater control is not anticipated for this project.

The contractor should anticipate the use of gravity fed sump pumps for construction phase dewatering of surface runoff, perched and infiltrating water, especially following wet weather periods. Surface water runoff must be controlled and diverted away from construction areas by grading and limiting the exposure of excavations to rainfall.

5.5 Foundations

Anticipated Bearing Strata: Proposed foundations are expected to bear partially within existing fill material, residual soils and/or weathered rock. As detailed throughout this report, the existing fill material (were encountered) will need to be overexcavated and replaced with approved structural fill material.

Shallow Foundation Design Criteria: Following overexcavation and replacement, Dynamic Earth recommends supporting the proposed structures on conventional shallow foundations bearing within structural fill material, residual soils and/or weathered rock. Foundations may be preliminarily designed to impart a maximum allowable net bearing pressure of 3,000 pounds per

square foot (psf). Foundations designed/extended to bear deeper to the underlying bedrock may be designed to impart a maximum allowable net bearing pressure of 4,000 psf. Regardless of loading conditions or ground improvement methods proposed foundations should be sized no less than the minimum dimensions of 24 inches for continuous wall footings, and 36 inches for isolated column footings.

Any footings subject to tension loads should be designed so that the maximum toe pressure due to the combined effect of vertical loads and overturning moment does not exceed the recommended maximum allowable net bearing pressure recommended above. In addition, positive contact pressure should be maintained throughout the base of the footings such that no uplift or tension exists between the base of the footings (vertically along the face of the foundation) should be neglected.

Lateral resistance should be provided by friction on the base of the footing with a recommended coefficient of friction against sliding:

- Formed concrete on gravel subbase material – 0.40;
- Mass concrete on gravel subbase material – 0.50; and
- Mass concrete on on-site natural soils - 0.35.

Partial Rock Support: Footings should not bear partially on rock and partially on soil due to the risk of brittle fracture at hinging points. Any foundation subgrades that would result in partially supported rock conditions should be overexcavated an additional six inches and replaced with well graded, compacted structural fill, per Section 5.3, to provide a cushion against brittle fracture. Alternatively, isolated spread footings may be extended to bear entirely on rock.

Frost Coverage: Exterior footings or foundations not protected from extreme temperatures should be placed at least 36 inches below adjacent exterior grades or as required by the local building code to provide protection from frost heave. Interior footings or foundations protected from extreme temperature (including during the period of construction) may be placed at a minimum depth of 18 inches below the slab subgrade.

Inspection/Overexcavation Criteria: As described in previous sections, existing fill material will need to be overexcavated below proposed foundations (were encountered). As such, a level of inspection and testing beyond routine footing bottom verification, by a testing laboratory will be required. Therefore, the suitability of the bearing soils along and below the footing bottoms should be verified by Dynamic Earth's geotechnical engineer prior to placing concrete. Any foundation overexcavation to be restored with structural fill must be excavated one foot laterally for each foot of vertical overexcavation. We recommend performing the overexcavation of unsuitable foundation subgrade soils prior to placing new fill material and subsequent to laying

out the proposed building foundations. Alternatively, lateral overexcavation may be minimized by backfilling the resulting overexcavation with lean concrete or flowable fill material.

Settlement: Dynamic Earth estimates post construction settlements of proposed building foundations to be less than one inch if the recommendations outlined in this report are properly implemented. Differential settlements of building foundations should be less than one-half inch.

5.6 Floor Slab

Properly prepared and inspected on-site soils are preliminarily expected to be suitable for support of proposed floor slabs. **Due to the potential variability of the existing fill material, at least partial overexcavation and replacement should be expected.** Furthermore, in-place densification and/or limited correlation and recompaction of loose existing fill material may be required. Any areas that become softened or disturbed as a result of wetting and/or repeated exposure to construction traffic should be removed and replaced with compacted structural fill. The properly prepared on-site soils are expected to yield a minimum subgrade modulus (k) of 125 psi/in.

A minimum four-inch layer of stone should be installed below the floor slabs to provide a capillary break. A vapor barrier beneath the floor slab is recommended. Total and post-construction settlements of floor slabs installed in accordance with the recommendations outlined in this report are estimated to be less than one-quarter inch.

5.7 Pavement Design Criteria

New pavement was not proposed at the time of this report. If new pavement areas are proposed, Dynamic Earth can assist with pavement design criteria.

5.8 Retaining Walls and Lateral Earth Pressures

Retaining walls and structures requiring lateral earth pressures were not identified at this time. Dynamic Earth should be notified if structures requiring lateral earth pressure estimates subsequently are proposed.

5.9 Seismic and Liquefaction Considerations

The soils are most consistent with a Site Class C defined by the *International Building Code*. Based on the seismic zone and soil profile, liquefaction considerations are not expected to have a substantial impact on design.

5.10 Temporary Excavations

The natural granular soils encountered during the investigation are consistent with Type C Soil Conditions as defined by 29 CFR Part 1926 (OSHA) which require a maximum unbraced excavation angle of 1.5:1 (horizontal:vertical). Actual conditions encountered during construction should be evaluated by a competent person (as defined by OSHA) to ensure that safe excavation methods and/or shoring and bracing requirements are implemented.

5.11 Seasonal High Groundwater and Soil Permeability

Seasonal high groundwater and groundwater was not encountered during our investigation. However, soil mottling was encountered to depths ranging between 2.7 feet and 3.2 feet below the ground surface. The soil mottling is anticipated to be due to a perched groundwater above the rock stratum. A summary of the seasonal high groundwater levels are presented in the following table:

SEASONAL HIGH GROUNDWATER SUMMARY					
Location	Surface Elevation (mse)	Mottling Depth		Estimated Seasonal High Groundwater	
		Depth (feet)	Elevation (mse)	Depth (feet)	Elevation (mse)
SPP-1	65.5	3.2	63.30	Not Encountered	
SPP-2	70.0	3.0	67.0	Not Encountered	
SPP-3	68.0	2.5	65.5	Not Encountered	
SPP-4	68.0	2.7	65.3	Not Encountered	

Tube permeameter samples were not collected due to the relatively coarse material and rock stratum encountered. If design permeability rates are required, Dynamic Earth recommends performing basin flood testing in accordance with the *New Jersey Best Management Practices Manual – Appendix E*.

5.12 Supplemental Post-Investigation Services

Construction Phase Inspection of Existing Fill Soils: The conditions disclosed by the soil borings preliminarily indicate that the existing fill material may be suitable for proposed floor slab support if evaluated and prepared as described herein. Existing fill material beneath the proposed building will need to be overexcavated and replaced with structural backfill in a controlled manner. However, there is a potential risk of variability in existing fill which may not be disclosed solely by soil borings because conventional auguring and split-spoon sampling only reveal a very limited section of subsurface materials. Therefore, the composition of the existing fill should be verified by visual observation and test pit excavations prior to or during the early phase of construction to enable further assessment of the depth, possible presence of voids, uncontrolled conditions, or

possible deleterious materials. If unsuitable conditions are encountered, alternative recommendations, possibly including additional overexcavation and replacement, may be required.

Construction Monitoring and Testing: The recommendations presented herein are contingent on the owner retaining Dynamic Earth to perform inspection, testing, and consultation during construction as described in previous sections of this report. **Construction phase evaluation by Dynamic Earth should be performed to further evaluate the lateral extent of existing fill material and make sure unsuitable soils are removed from below proposed foundations.** In addition, limited overexcavation and replacement of fill material within floor slab areas and/or special handling should be expected. **Construction phase evaluation by means of dynamic cone penetrometer (DCP) testing should be performed on the natural soils in order to confirm design bearing capacities for the proposed structures.** Monitoring and testing should also be performed to verify that suitable materials are used for controlled fill, and that they are properly placed and compacted over suitable subgrade soils. Testing of fill placement will also be critical to limiting differential settlement.

6.0 GENERAL COMMENTS

Supplemental recommendations may be required upon finalization of construction plans or if significant changes are made in the characteristics or location of the proposed structure. Dynamic Earth should be included as a consultant to the design team and should be provided final plans for review to confirm these criteria apply or to modify recommendations as necessary.

The recommendations presented herein should be utilized by a qualified engineer in preparing the project plans and specifications. The engineer should consider these recommendations as minimum physical standards that may be superseded by local and regional building codes and structural considerations. These recommendations are prepared for the use of the client for the specific project detailed and should not be used by any third party. These recommendations are relevant to the design phase and should not be substituted for construction specifications.

The possibility exists that conditions between borings may differ from those at specific boring locations, and conditions may not be as anticipated by the designers or contractors. In addition, the construction process may itself alter soil conditions. Therefore, Dynamic Earth's Geotechnical Engineers or their representatives should observe and document the construction procedures used and the conditions encountered, as well as conduct testing and inspection to ensure the design criteria are met or recommendations to address deviations are implemented.

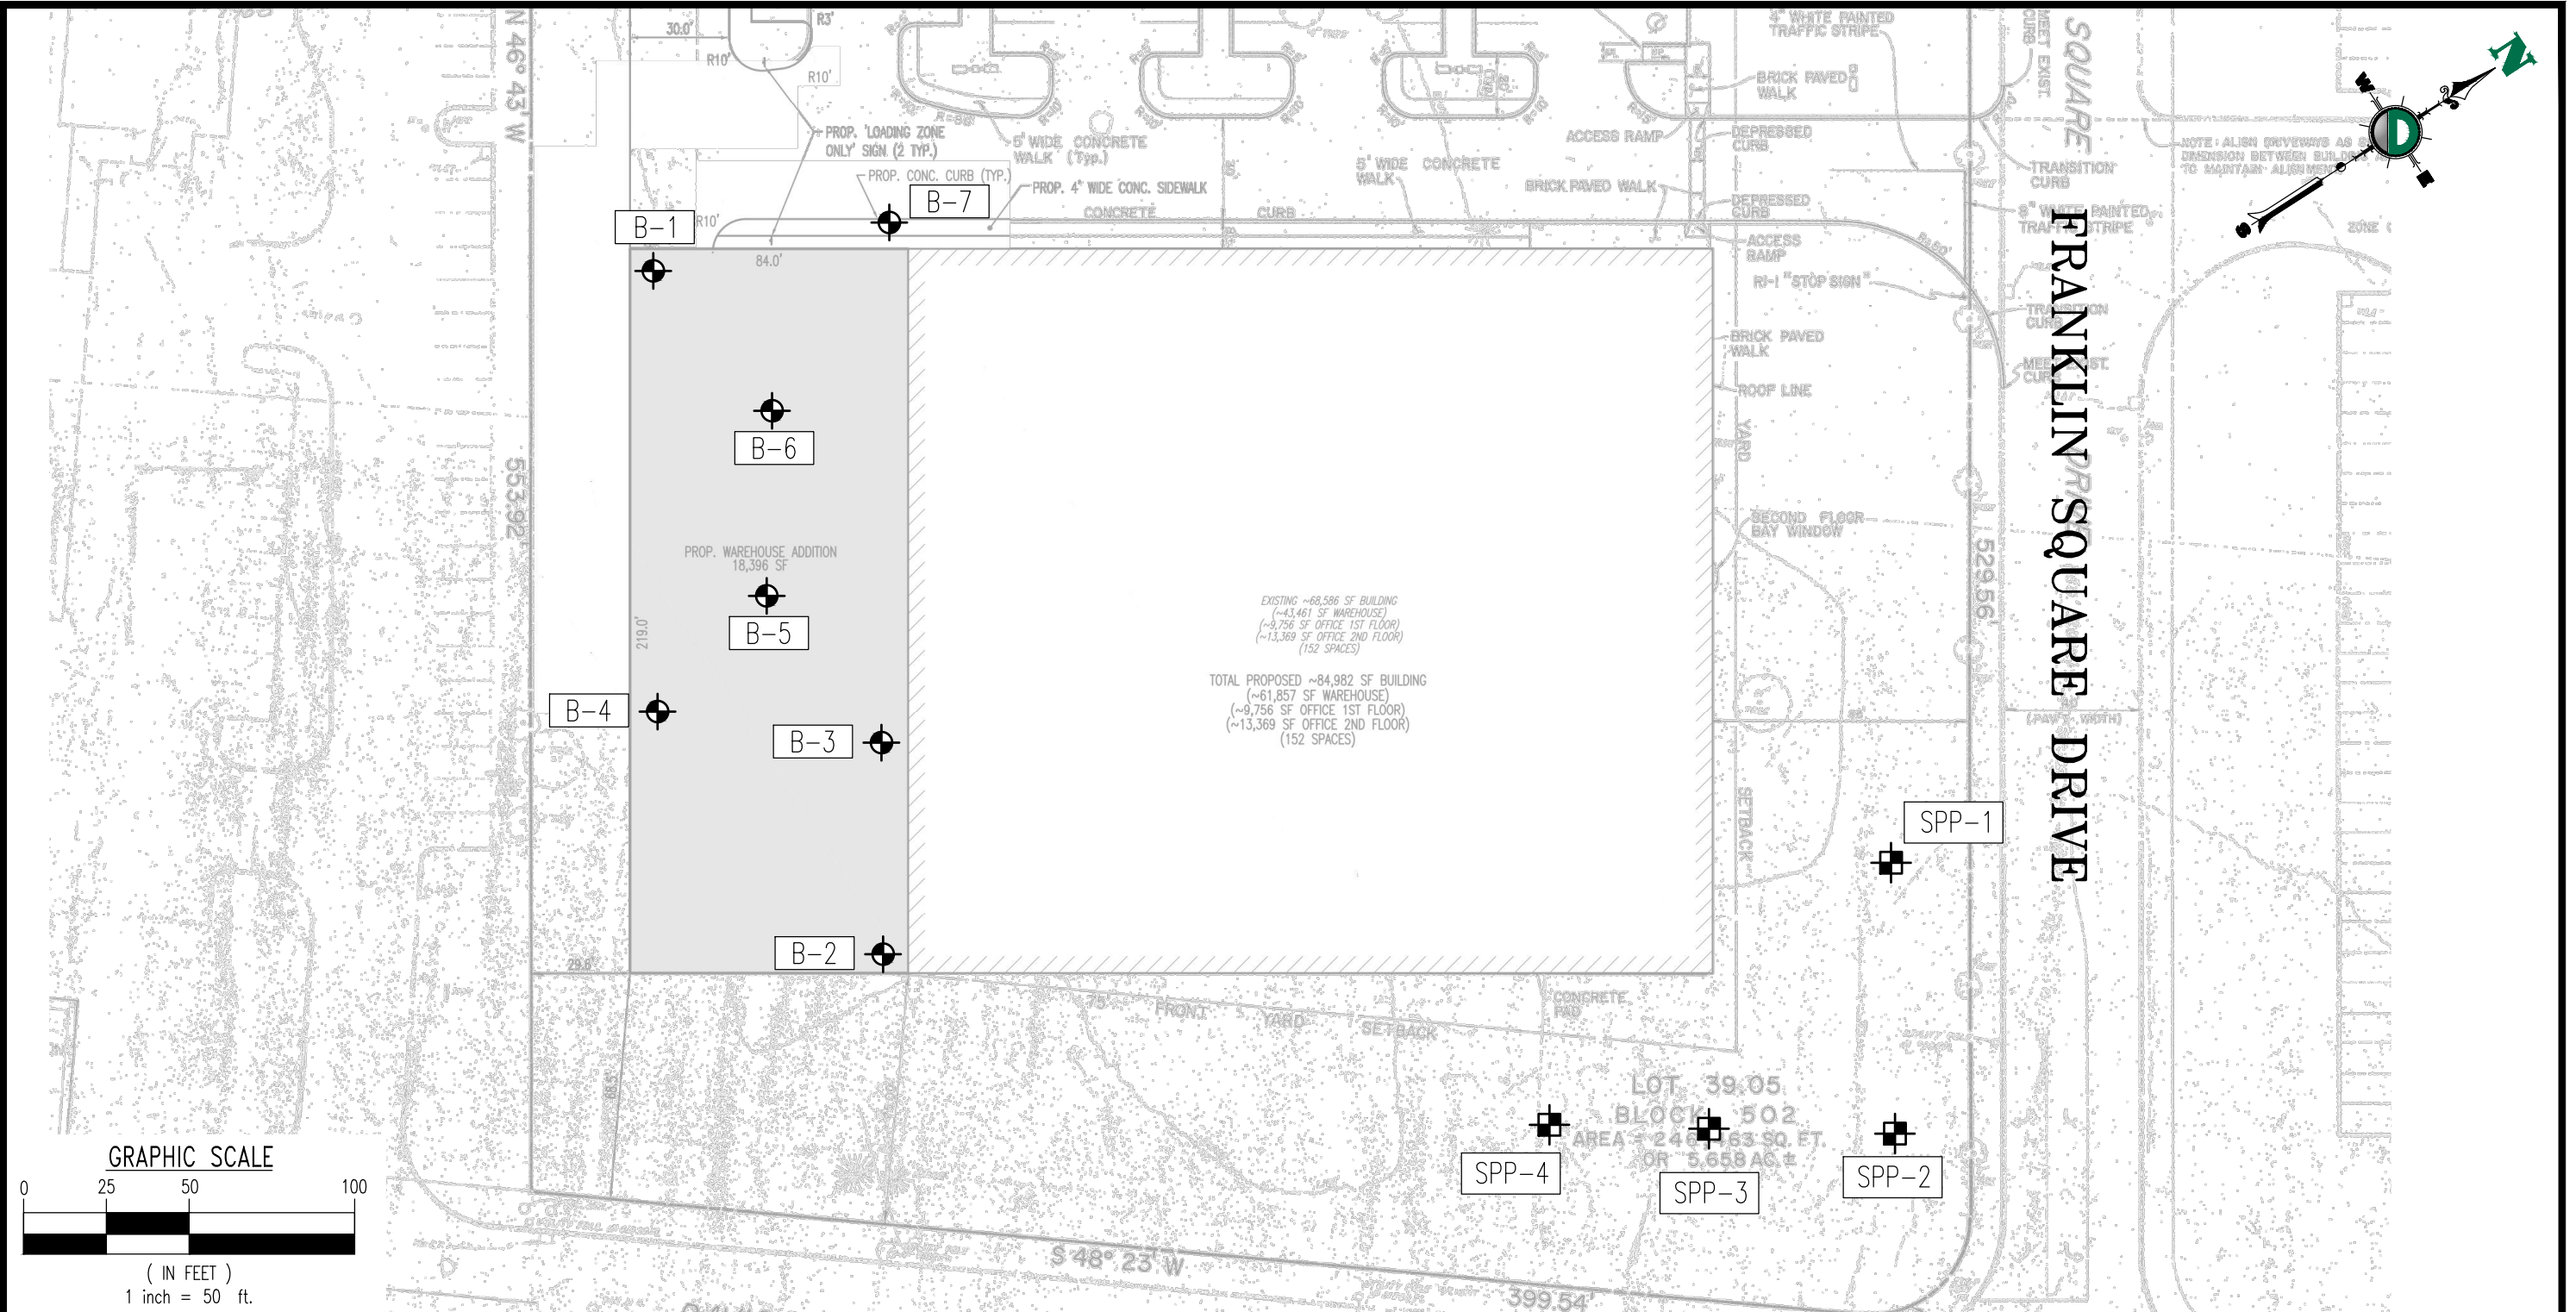

Dynamic Earth assumes that a qualified contractor will be employed to perform the construction work, and that the contractor will be required to exercise care to ensure all excavations are performed in accordance with applicable regulations and good practice. Particular attention should be paid to avoiding damaging or undermining adjacent properties and maintaining slope stability.

The exploration and analysis of the foundation conditions reported herein are presented to form a reasonable basis for foundation design. The recommendations submitted for the proposed construction are based on the available soil information and the preliminary design details furnished or assumed. Deviations from the noted subsurface conditions encountered during construction should be brought to the attention of the geotechnical engineer.

The geotechnical engineer warrants that the findings, recommendations, specifications, or professional advice contained herein have been promulgated after being prepared in accordance with generally accepted professional engineering practice in the fields of foundation engineering, soil mechanics, and engineering geology. No other warranties are implied or expressed.

GEOTECHNICAL TERMS AND SYMBOLS

SAMPLE IDENTIFICATION

The Unified Soil Classification System is used to identify the soil unless otherwise noted.

SOIL PROPERTY SYMBOLS

- N: Standard Penetration Value: Blows per ft. or a 140 lb. hammer falling 30" on a 2" O.D. split-spoon.
- Qu: Unconfined compressive strength, TSF.
- Qp: Penetrometer value, unconfined compressive strength, TSF.
- Mc: Moisture content, %
- LL: Liquid limit, %
- PI: Plasticity index, %
- δd: Natural dry density, PCF.
- ▼: Apparent groundwater level at time noted after completion of boring.
- =

DRILLING AND SAMPLING SYMBOLS

- NE: Not Encountered (Groundwater was not encountered)
- SS: Split-Spoon – 1½" I.D., 2" O.D., except where noted
- ST: Shelby Tube – 3" O.D., except where noted
- AU: Auger Sample
- OB: Diamond Bit
- CB: Carbide Bit
- WS: Washed Sample

RELATIVE DENSITY AND CONSISTENCY CLASSIFICATION

<u>Term (Non-Cohesive Soils)</u>	<u>Standard Penetration Resistance</u>
Very Loose	0-4
Loose	4-10
Medium Dense	10-30
Dense	30-50
Very Dense	Over 50

<u>Term (Cohesive Soils)</u>	<u>Qu (TSF)</u>
Very Soft	0-0.25
Soft	0.25-0.50
Firm (Medium)	0.50-1.00
Stiff	1.00-2.00
Very Stiff	2.00-4.00
Hard	4.00 +

PARTICLE SIZE

Boulders	8 in. +	Coarse Sand	5mm-0.6mm	Silt	0.074mm-0.005mm
Cobbles	8 in. – 3 in.	Medium Sand	0.6mm-0.2mm	Clay	- 0.005mm
Gravel	3 in. – 5mm	Fine Sand	0.2mm – 0.074mm		

USCS Standard Classification System

UNIFIED SOIL CLASSIFICATION SYSTEM - ASTM D2488

MAJOR DIVISION		GROUP SYMBOL	LETTER SYMBOL	GROUP NAME	
COARSE GRAINED SOILS CONTAINS MORE THAN 50% FINES	GRAVEL AND GRAVELLY SOILS MORE THAN 50% OF COARSE FRACTION RETAINED ON NO. 4 SIEVE	GRAVEL WITH * 5% FINES		GW	Well-graded GRAVEL
				GP	Poorly graded GRAVEL
		GRAVEL WITH BETWEEN 5% AND 15% FINES		GW-GM	Well-graded GRAVEL with silt
				GW-GC	Well-graded GRAVEL with clay
				GP-GM	Poorly graded GRAVEL with silt
				GP-GC	Poorly graded GRAVEL with clay
	GRAVEL WITH ≥ 15% FINES		GM	Silty GRAVEL	
			GC	Clayey GRAVEL	
	SAND AND SANDY SOILS MORE THAN 50% OF COARSE FRACTION PASSING ON NO. 4 SIEVE	SAND WITH * 5% FINES		SW	Well-graded SAND
				SP	Poorly graded SAND
		SAND WITH BETWEEN 5% AND 15% FINES		SW-SM	Well-graded SAND with silt
				SW-SC	Well-graded SAND with clay
				SP-SM	Poorly graded SAND with silt
				SP-SC	Poorly graded SAND with clay
SAND WITH ≥ 15% FINES			SM	Silty SAND	
			SC	Clayey SAND	
FINE GRAINED SOILS CONTAINS MORE THAN 50% FINES	SILT AND CLAY		ML	Inorganic SILT with low plasticity	
			CL	Lean inorganic CLAY with low plasticity	
			OL	Organic SILT with low plasticity	
	LIQUID LIMIT <u>GREATER</u> THAN 50		MH	Elastic inorganic SILT with moderate to high plasticity	
			CH	Fat inorganic CLAY with moderate to high plasticity	
			OH	Organic SILT or CLAY with moderate to high plasticity	
HIGHLY ORGANIC SOILS			PT	PEAT soils with high organic contents	

NOTES:

- 1) Sample descriptions are based on visual field and laboratory observations using classification methods of ASTM D2488. Where laboratory data are available, classifications are in accordance with ASTM D2487.
- 2) Solid lines between soil descriptions indicate change in interpreted geologic unit. Dashed lines indicate stratigraphic change within the unit.
- 3) Fines are material passing the U.S. Std. #200 Sieve.

Regarding: SUPPLEMENTAL STORMWATER BASIN AREA INVESTIGATION & PERMEABILITY TESTING SERVICES

**300 Franklin Square Drive
Block 502.2, Lot 39.05
Township of Franklin,
Somerset County, New Jersey
Dynamic Earth Project No. 2137-99-001E**

Dear Mr. Subramanian,

Dynamic Earth, LLC (Dynamic Earth) previously completed a *Stormwater Basin Area Investigation Report* dated May 11, 2018 for the above referenced project. Subsequent to our initial investigation site plans were updated and a supplemental stormwater basin area investigation was performed as requested.

Project Description

At the time of our supplemental testing, the subject site was developed with an existing two-story masonry building with associated pavement and utilities. The proposed site improvements will include the construction of an addition along the western and southern wall of the existing warehouse. Additional site improvements are expected to include underground stormwater management facility within the northwestern portion of the site. Proposed site improvements were provided on a February 21, 2019 *Grading Plan* prepared by Dynamic Engineering Consultants, PC (Dynamic)

Scope of Services

Dynamic Earth's scope of services pertaining to this data report included evaluating the subsurface conditions at soil profile pits to estimate the apparent seasonal high groundwater level. Two soil profile pits (identified as SPP-100 through SPP-101) were excavated at the site using a rubber tire backhoe. Since relatively shallow rock was encountered during the excavation, basin flood testing was performed in accordance with the New Jersey Department of Environmental Protection (NJDEP) *Best Management Practices (BMP) Manual- Appendix E*. Test locations were located within the area of proposed stormwater management facilities and were backfilled to the surface with excavated soils. The test locations are shown on the attached *Supplemental Soil Profile Pit Location Plan*.

Field Investigation

Field exploration of this investigation was conducted by means of two supplemental test pits (identified as TP-100 through TP-101). The test pits were excavated with a rubber-tired backhoe. The testing locations are shown on the accompanying *Supplemental Test Pit Location Plan* within the Appendix of this letter.

Test pits were completed in the presence of a Dynamic Earth engineer who performed field tests, recorded visual classifications, and collected samples of the various strata encountered. The test locations were located in the field using normal taping procedures and estimated right angles. These locations are presumed to be accurate within several feet with the location plotted on the plans.

Basin flood testing was conducted within/near proposed stormwater management facilities in accordance with Appendix E of the NJDEP *BMP Manual*. The soils encountered were classified using the United States Department of Agriculture (USDA) classification system. Observations were made for groundwater and/or soil mottling and mineral deposits potentially indicative of zones of saturation or seasonal high groundwater. Soil logs and results of the basin flood testing are included in the Appendix.

3.0 Summary of Subsurface Conditions

Detailed descriptions of the subsurface conditions encountered at each location are provided on the *Records of Subsurface Exploration* included herein. A summary of the subsurface conditions encountered is included below.

Test pits were performed within landscape areas and encountered between approximately six inches and 12 inches of topsoil at the surface. Beneath the surface cover, residual soils were encountered that consisted of loam, silt loam and silty clay loam with variable amounts of channers and flagstones. The residual soils were encountered to refusal depths ranging between approximately six feet and eight feet below the ground surface; corresponding to elevations ranging between 58.5 and 56 feet above mean sea elevation (mse). The refusal encountered is expected to be the top of rock/

4.0 Seasonal High Groundwater and Basin Flood Test

Groundwater and evidence of seasonal high groundwater were not encountered during our investigation. The groundwater levels are expected to fluctuate seasonally and following periods of significant precipitation. The results of the subsurface investigation are summarized below.

SEASONAL HIGH GROUNDWATER AND PERMEABILITY TEST SUMMARY			
Location	Surface Elevation (mse)	Estimated Seasonal High Groundwater	
		Depth (Feet)	Elevation (mse)
TP-100	64.5	Not Encountered	
TP-101	64.0	Not Encountered	

Basin Flood Test Results: Basin flood tests were performed at depths ranging between six feet and eight feet below the ground surface. As detailed on the following table, one basin did not fully drain; therefore, the rock is considered massive. One location drained within 12 hours after the initial pre-soak period and the rock may be condensed fractured. Detailed basin flood test results can be found in the Appendix. A summary of the basin flood tests results is tabulated below:

FIELD PERMEABILITY TEST RESULTS SUMMARY				
Test Pit Location	Test Depth (feet)	Basin Flood Test Results (After Initial 24 Hr Pre-Soak)		Permeability ¹ (Inches/Hour)
		Drained Within 12 Hours	Drained Within 24 Hours	
TP-100	6.0	No	No	N/A
TP-101	8.0	Yes	Yes	0.5

¹Per NJDEP Stormwater BMP Manual

While one location encountered fractured rock, we do not recommend designing a system that relies on infiltration, as there is a relatively high risk that occasional fractures encountered during this investigation will become filled.

5.0 General Comments

The recommendations presented herein should be utilized by a qualified engineer in preparing the project plans and specifications. The engineer should consider these recommendations as minimum physical standards that may be superseded by local and regional building codes and structural considerations. These recommendations are prepared for the use of the client for the specific project detailed and should not be used by any third party. These recommendations are relevant to the design phase and should not be substituted for construction specifications.

The possibility exists that conditions between test locations may differ, and conditions may not be as anticipated by the designers or contractors. In addition, the construction process may itself alter soil conditions. Therefore, Dynamic Earth's Geotechnical Engineers or their representatives should observe and document the construction procedures used and the conditions encountered, as well as conduct testing and inspection to ensure the design criteria are met or recommendations to address deviations are implemented.

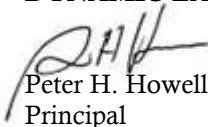

Dynamic Earth assumes that a qualified contractor will be employed to perform the construction work, and that the contractor will be required to exercise care to ensure all excavations are performed in accordance with applicable regulations and good practice.

The recommendations submitted for the proposed construction are based on the available soil information and the preliminary design details furnished or assumed. Deviations from the noted subsurface conditions encountered during construction should be brought to the attention of the geotechnical engineer.

The geotechnical engineer warrants that the findings, recommendations, specifications, or professional advice contained herein have been promulgated after being prepared in accordance with generally accepted professional engineering practice in the fields of foundation engineering, soil mechanics, and engineering geology. No other warranties are implied or expressed.

Please do not hesitate to contact us with any questions regarding these matters.

Sincerely,
DYNAMIC EARTH, LLC
